
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	37
Program Memory Size	16KB (5.5K x 24)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5V
Data Converters	A/D 22x10b/12b; D/A 2x8b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	48-UFQFN Exposed Pad
Supplier Device Package	48-UQFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fv16km204-i-mv

FIGURE 3-1: PIC24F CPU CORE BLOCK DIAGRAM

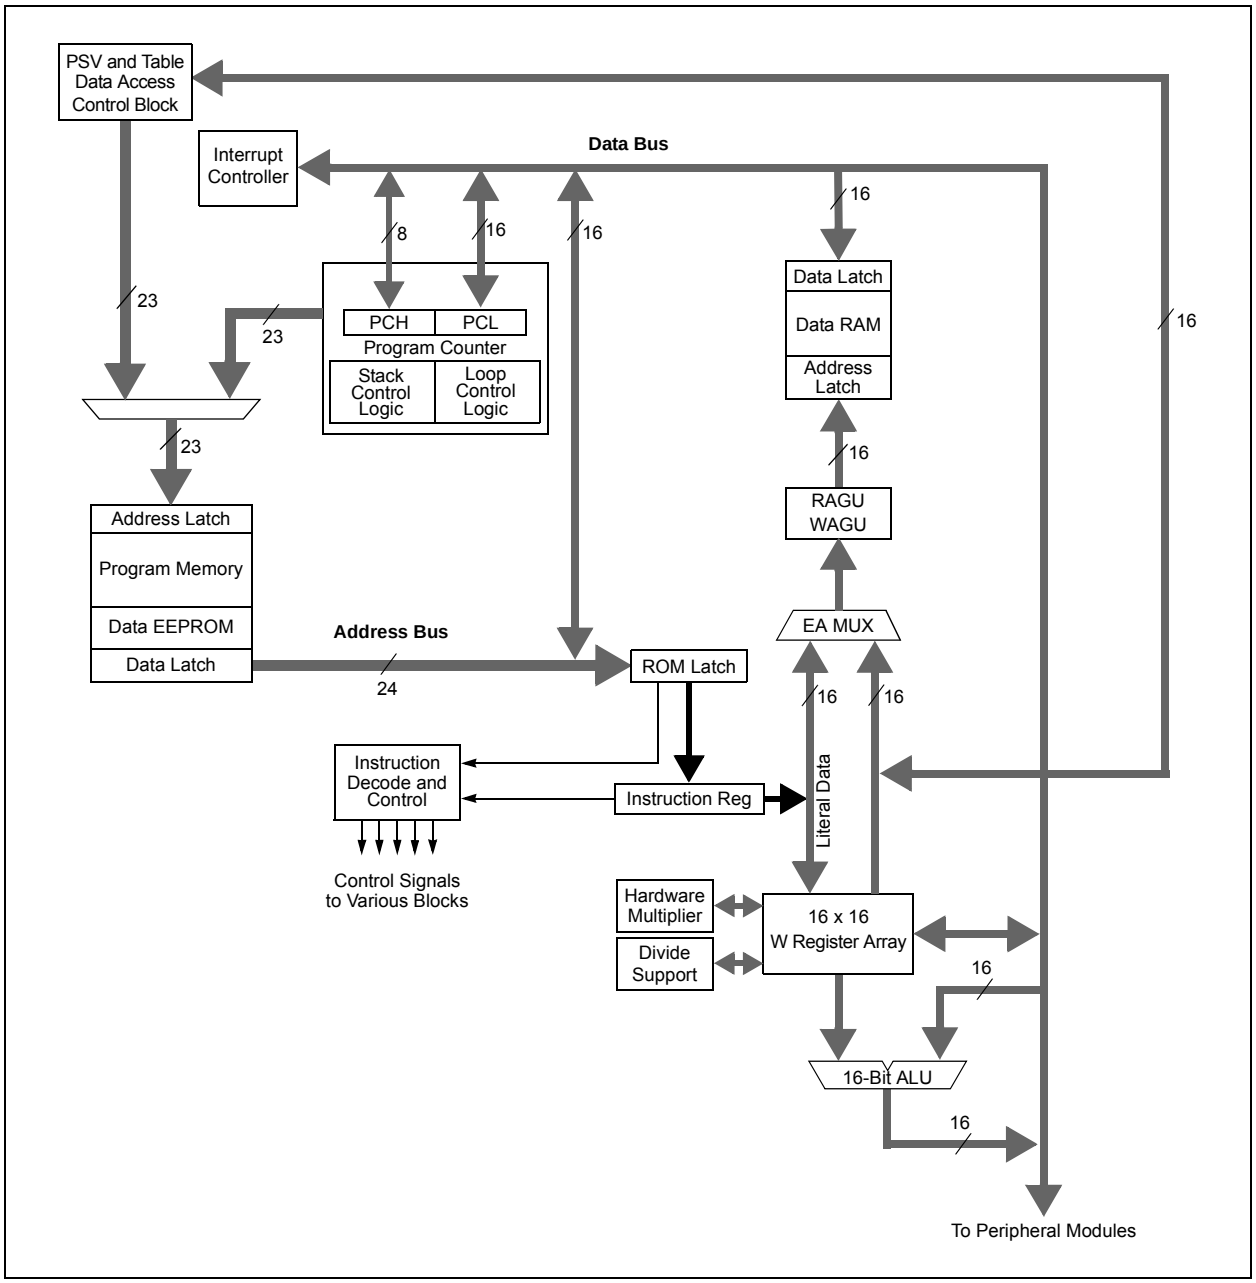

TABLE 3-1: CPU CORE REGISTERS

Register(s) Name	Description
W0 through W15	Working Register Array
PC	23-Bit Program Counter
SR	ALU STATUS Register
SPLIM	Stack Pointer Limit Value Register
TBLPAG	Table Memory Page Address Register
PSVPAG	Program Space Visibility Page Address Register
RCOUNT	Repeat Loop Counter Register
CORCON	CPU Control Register

4.0 MEMORY ORGANIZATION

As with Harvard architecture devices, the PIC24F microcontrollers feature separate program and data memory space and busing. This architecture also allows the direct access of program memory from the Data Space (DS) during code execution.

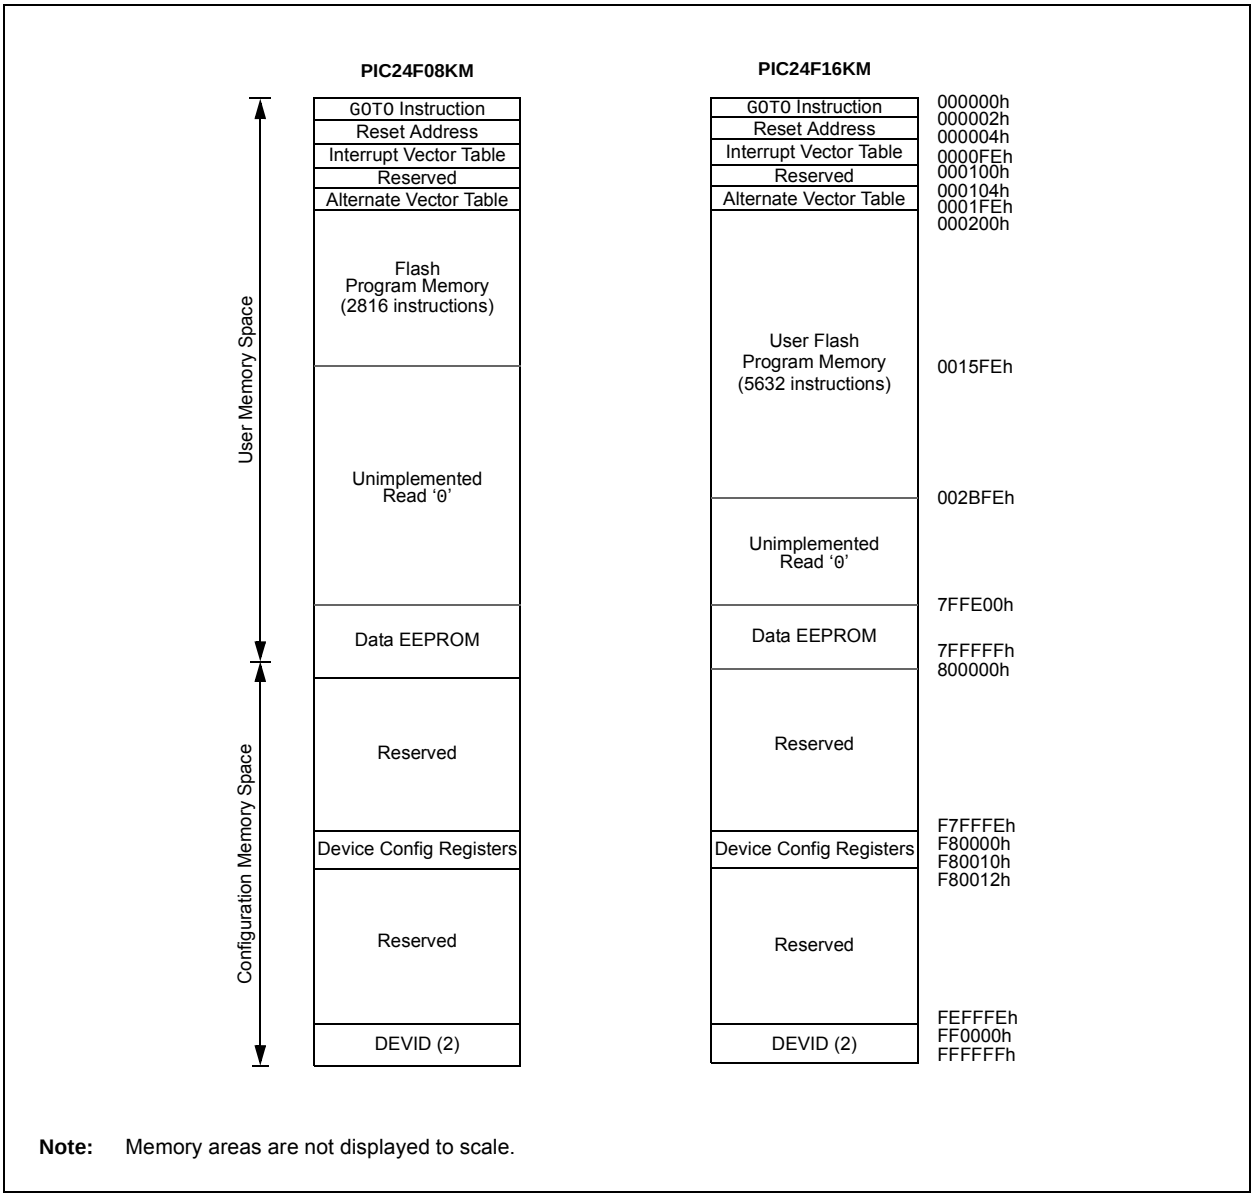
4.1 Program Address Space

The program address memory space of the PIC24F devices is 4M instructions. The space is addressable by a 24-bit value derived from either the 23-bit Program Counter (PC) during program execution, or from a table operation or Data Space remapping, as described in **Section 4.3 "Interfacing Program and Data Memory Spaces"**.

The user access to the program memory space is restricted to the lower half of the address range (000000h to 7FFFFFh). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

Memory maps for the PIC24FV16KM204 family of devices are displayed in Figure 4-1.

FIGURE 4-1: PROGRAM SPACE MEMORY MAP FOR PIC24FXXXXX FAMILY DEVICES



Note: Memory areas are not displayed to scale.

7.2.1 POR AND LONG OSCILLATOR START-UP TIMES

The oscillator start-up circuitry and its associated delay timers are not linked to the device Reset delays that occur at power-up. Some crystal circuits (especially low-frequency crystals) will have a relatively long start-up time. Therefore, one or more of the following conditions is possible after $\overline{\text{SYSRST}}$ is released:

- The oscillator circuit has not begun to oscillate.
- The Oscillator Start-up Timer (OST) has not expired (if a crystal oscillator is used).
- The PLL has not achieved a lock (if PLL is used).

The device will not begin to execute code until a valid clock source has been released to the system. Therefore, the oscillator and PLL start-up delays must be considered when the Reset delay time must be known.

7.2.2 FAIL-SAFE CLOCK MONITOR (FSCM) AND DEVICE RESETS

If the FSCM is enabled, it will begin to monitor the system clock source when $\overline{\text{SYSRST}}$ is released. If a valid clock source is not available at this time, the device will automatically switch to the FRC Oscillator and the user can switch to the desired crystal oscillator in the Trap Service Routine (TSR).

7.3 Special Function Register Reset States

Most of the Special Function Registers (SFRs) associated with the PIC24F CPU and peripherals are reset to a particular value at a device Reset. The SFRs are grouped by their peripheral or CPU function and their Reset values are specified in each section of this manual.

The Reset value for each SFR does not depend on the type of Reset, with the exception of four registers. The Reset value for the Reset Control register, RCON, will depend on the type of device Reset. The Reset value for the Oscillator Control register, OSCCON, will depend on the type of Reset and the programmed values of the FNOSCx bits in the Flash Configuration Word (FOSCSEL<2:0>); see Table 7-2. The RCFGCAL and NVMCON registers are only affected by a POR.

7.4 Brown-out Reset (BOR)

The PIC24FXXXXX family devices implement a BOR circuit, which provides the user several configuration and power-saving options. The BOR is controlled by the BORV<1:0> and BOREN<1:0> Configuration bits (FPOR<6:5,1:0>). There are a total of four BOR configurations, which are provided in Table 7-3.

The BOR threshold is set by the BORV<1:0> bits. If BOR is enabled (any values of BOREN<1:0>, except '00'), any drop of V_{DD} below the set threshold point will reset the device. The chip will remain in BOR until V_{DD} rises above the threshold.

If the Power-up Timer is enabled, it will be invoked after V_{DD} rises above the threshold. Then, it will keep the chip in Reset for an additional time delay, T_{PWRT}, if V_{DD} drops below the threshold while the Power-up Timer is running. The chip goes back into a BOR and the Power-up Timer will be initialized. Once V_{DD} rises above the threshold, the Power-up Timer will execute the additional time delay.

BOR and the Power-up Timer (PWRT) are independently configured. Enabling the Brown-out Reset does not automatically enable the PWRT.

7.4.1 LOW-POWER BOR (LPBOR)

The Low-Power BOR is an alternate setting for the BOR, designed to consume minimal power. In LPBOR mode, BORV<1:0> (FPOR<6:5>) = 00. The BOR trip point is approximately 2.0V. Due to the low current consumption, the accuracy of the LPBOR mode can vary.

Unlike the other BOR modes, LPBOR mode will not cause a device Reset when V_{DD} drops below the trip point. Instead, it re-arms the POR circuit to ensure that the device will reset properly in the event that V_{DD} continues to drop below the minimum operating voltage.

The device will continue to execute code when V_{DD} is below the level of the LPBOR trip point. A device that requires falling edge BOR protection to prevent code from improperly executing should use one of the other BOR voltage settings.

Note 1: This bit is automatically cleared when the ROI bit is set and an interrupt occurs.

10.0 POWER-SAVING FEATURES

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **"Power-Saving Features with VBAT"** (DS30622).

This FRM describes some features which are not implemented in this device. Sections related to the VBAT pin and Deep Sleep do not apply to the PIC24FV16KM204 family.

The PIC24FV16KM204 family of devices provides the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power. All PIC24F devices manage power consumption in four different ways:

- Clock Frequency
- Instruction-Based Sleep and Idle modes
- Software Controlled Doze mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption, while still maintaining critical application features, such as timing-sensitive communications.

10.1 Clock Frequency and Clock Switching

PIC24F devices allow for a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits. The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 9.0 "Oscillator Configuration"**.

10.2 Instruction-Based Power-Saving Modes

PIC24F devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution; Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation.

The 'C' syntax of the PWRSAV instruction is shown in Example 10-1.

Note: SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to "wake-up".

10.2.1 SLEEP MODE

Sleep mode includes these features:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption will be reduced to a minimum provided that no I/O pin is sourcing current.
- The I/O pin directions and states are frozen.
- The Fail-Safe Clock Monitor does not operate during Sleep mode since the system clock source is disabled.
- The LPRC clock will continue to run in Sleep mode if the WDT or RTCC with LPRC as the clock source is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals may continue to operate in Sleep mode. This includes items, such as the Input Change Notification on the I/O ports or peripherals that use an External Clock input. Any peripheral that requires the system clock source for its operation will be disabled in Sleep mode.

The device will wake-up from Sleep mode on any of these events:

- On any interrupt source that is individually enabled
- On any form of device Reset
- On a WDT time-out

On wake-up from Sleep, the processor will restart with the same clock source that was active when Sleep mode was entered.

EXAMPLE 10-1: 'C' POWER-SAVING ENTRY

```
Sleep();              //Put the device into Sleep mode
Idle();               //Put the device into Idle mode
```

NOTES:

17.1 Control Registers

The CLCx module is controlled by the following registers:

- CLCxCONL
- CLCxCONH
- CLCxSEL
- CLCxGLSL
- CLCxGLSH

The CLCx Control registers (CLCxCONL and CLCxCONH) are used to enable the module and interrupts, control the output enable bit, select output polarity and select the logic function. The CLCx Control registers also allow the user to control the logic polarity of not only the cell output, but also some intermediate variables.

The CLCx Source Select register (CLCxSEL) allows the user to select up to 4 data input sources using the 4 data input selection multiplexers. Each multiplexer has a list of 8 data sources available.

The CLCx Gate Logic Select registers (CLCxGLSL and CLCxGLSH) allow the user to select which outputs from each of the selection MUXes are used as inputs to the input gates of the logic cell. Each data source MUX outputs both a true and a negated version of its output. All of these 8 signals are enabled, ORed together by the logic cell input gates.

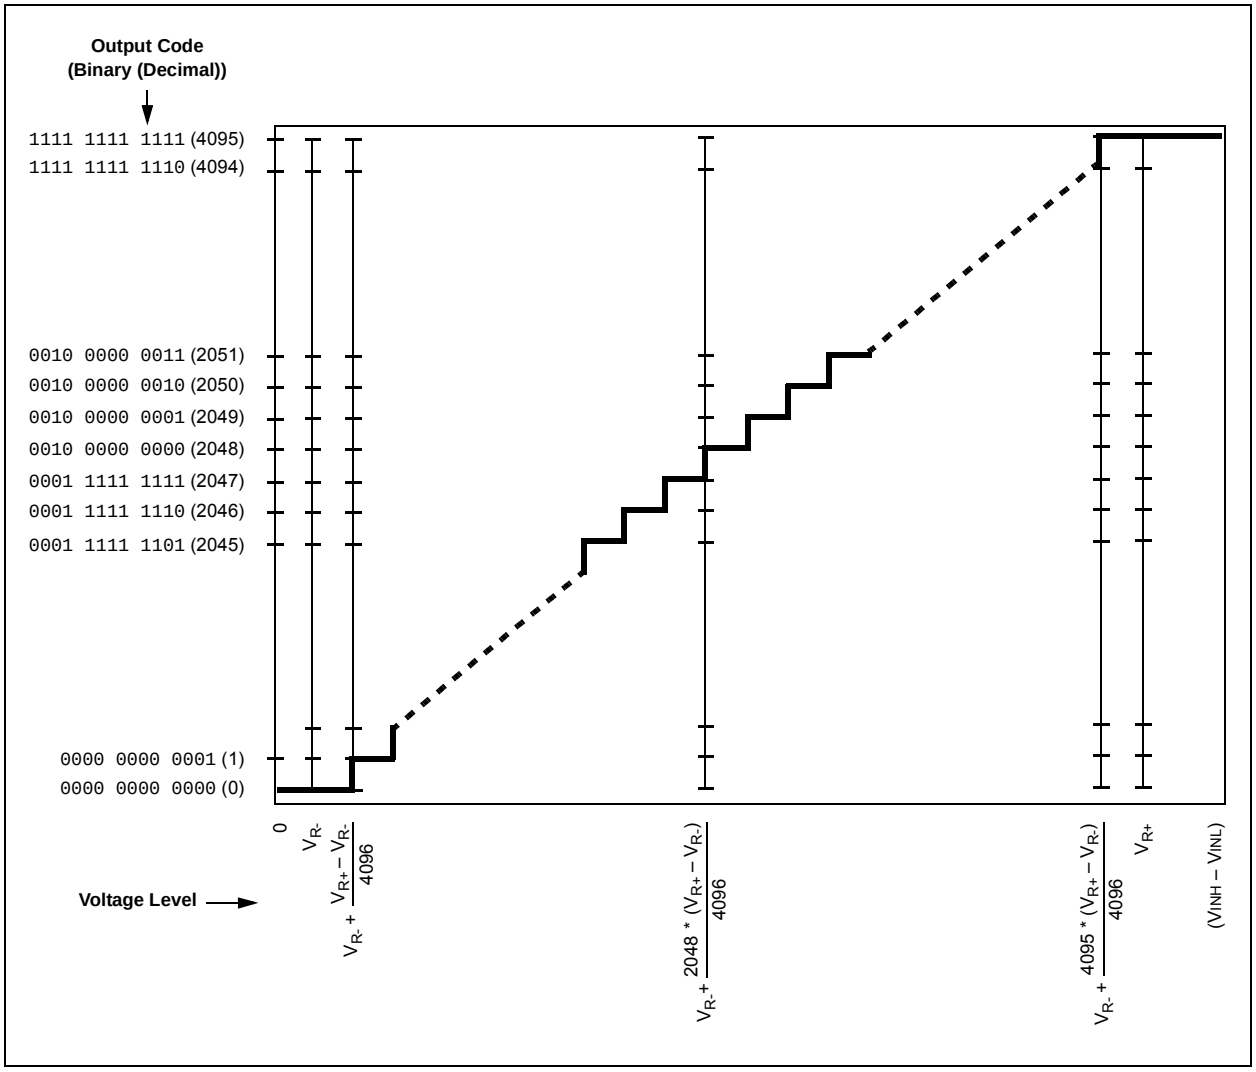
19.3 Transfer Function

The transfer functions of the A/D Converter in 12-bit resolution are shown in Figure 19-3. The difference of the input voltages ($V_{INH} - V_{INL}$) is compared to the reference ((V_{R+}) – (V_{R-})).

- The first code transition occurs when the input voltage is ((V_{R+}) – (V_{R-}))/4096 or 1.0 LSb.
- The '0000 0000 0001' code is centered at V_{R-} + (1.5 * ((V_{R+}) – (V_{R-}))/4096).
- The '0010 0000 0000' code is centered at V_{REFL} + (2048.5 * ((V_{R+}) – (V_{R-}))/4096).
- An input voltage less than V_{R-} + (((V_{R-}) – (V_{R-}))/4096) converts as '0000 0000 0000'.
- An input voltage greater than (V_{R-}) + (4095 ((V_{R+}) – (V_{R-}))/4096) converts as '1111 1111 1111'.

FIGURE 19-3: 12-BIT A/D TRANSFER FUNCTION



REGISTER 20-1: DACxCON: DACx CONTROL REGISTER

R/W-0	U-0	R/W-0	R/W-0	R/W-0	U-0	R/W-0	R/W-0
DACEN	—	DACSIDL	DACSLP	DACFM	—	SRDIS	DACTRIG
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
DACOE	DACTSEL4	DACTSEL3	DACTSEL2	DACTSEL1	DACTSEL0	DACREF1	DACREF0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as ‘0’	
-n = Value at POR	‘1’ = Bit is set	‘0’ = Bit is cleared	x = Bit is unknown

bit 15 **DACEN:** DACx Enable bit
1 = Module is enabled
0 = Module is disabled

bit 14 **Unimplemented:** Read as ‘0’

bit 13 **DACSIDL:** DACx Stop in Idle Mode bit
1 = Discontinues module operation when device enters Idle mode
0 = Continues module operation in Idle mode

bit 12 **DACSLP:** DACx Enable Peripheral During Sleep bit
1 = DACx continues to output the most recent value of DACxDAT during Sleep mode
0 = DACx is powered down in Sleep mode; DACxOUT pin is controlled by the TRISx and LATx bits

bit 11 **DACFM:** DACx Data Format Select bit
1 = Data is left justified (data stored in DACxDAT<15:8>)
0 = Data is right justified (data stored in DACxDAT<7:0>)

bit 10 **Unimplemented:** Read as ‘0’

bit 9 **SRDIS:** Soft Reset Disable bit
1 = DACxCON and DACxDAT SFRs reset only on a POR or BOR Reset
0 = DACxCON and DACxDAT SFRs reset on any type of device Reset

bit 8 **DACTRIG:** DACx Trigger Input Enable bit
1 = Analog output value updates when the selected (by DACTSEL<4:0>) event occurs
0 = Analog output value updates as soon as DACxDAT is written (DAC Trigger is ignored)

bit 7 **DACOE:** DACx Output Enable bit
1 = DACx output pin is enabled and driven on the DACxOUT pin
0 = DACx output pin is disabled, DACx output is available internally to other peripherals only

Note 1: BGBUF1 voltage is configured by BUFREF<1:0> (BUFCON0<1:0>).

21.0 DUAL OPERATIONAL AMPLIFIER MODULE

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"PIC24F Family Reference Manual"*, **"Operational Amplifier (Op Amp)"** (DS30505). Device-specific information in this data sheet supersedes the information in the *"PIC24F Family Reference Manual"*.

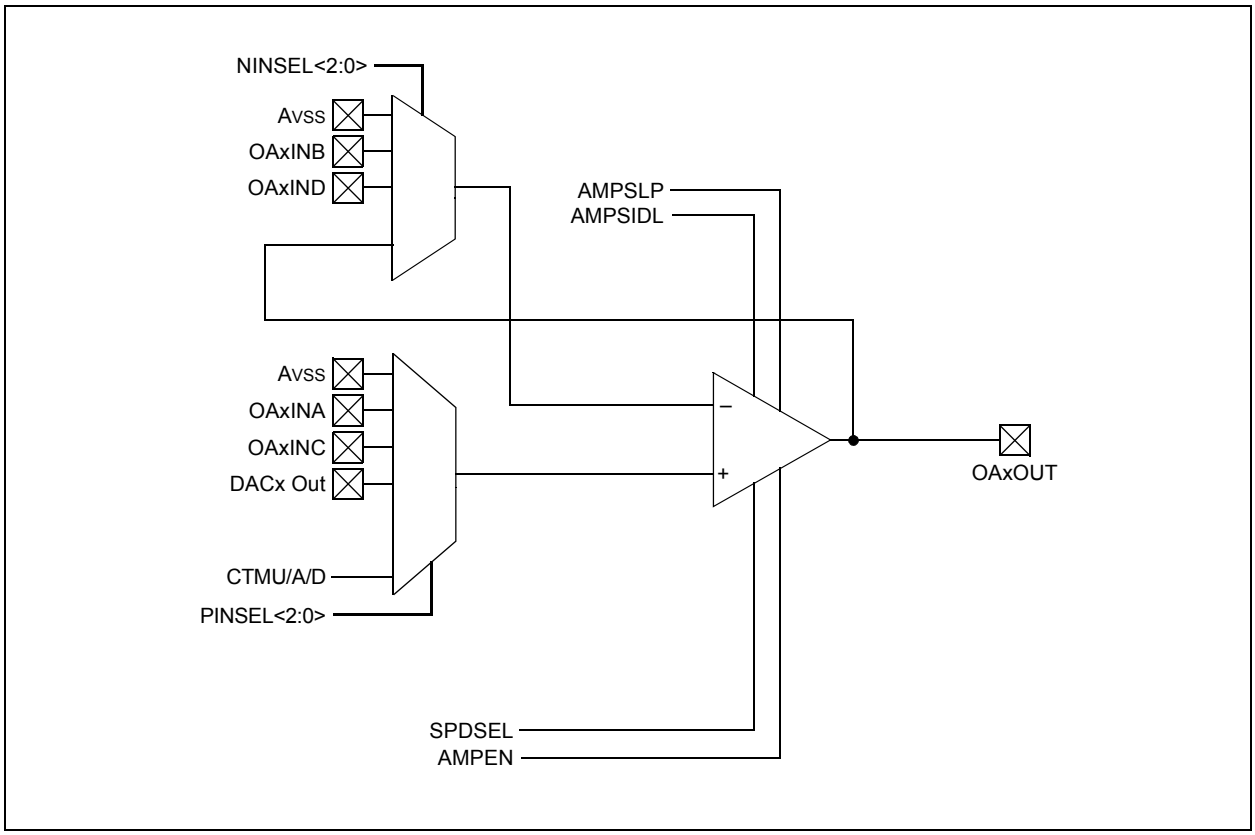
PIC24FV16KM204 family devices include two operational amplifiers to complement the microcontroller's other analog features. They may be used to provide analog signal conditioning, either as stand-alone devices or in addition to other analog peripherals.

The two op amps are functionally identical; the block diagram for a single amplifier is shown in Figure 21-1. Each op amp has these features:

- Internal unity-gain buffer option
- Multiple input options each on the inverting and non-inverting amplifier inputs
- Rail-to-rail input and output capabilities
- User-selectable option for regular or low-power operation
- User-selectable operation in Idle and Sleep modes

When using the op amps, it is recommended to set the ANSx and TRISx bits of both the input and output pins to configure them as analog pins. See **Section 11.2 "Configuring Analog Port Pins"** for more information.

FIGURE 21-1: SINGLE OPERATIONAL AMPLIFIER BLOCK DIAGRAM



27.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC24FV16KM204 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC24FV16KM204 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings(†)

Ambient temperature under bias ..... -40°C to +125°C
Storage temperature ..... -65°C to +150°C
Voltage on V_{DD} with respect to V_{SS} (PIC24FXXKMXXX) ..... -0.3V to +4.5V
Voltage on V_{DD} with respect to V_{SS} (PIC24FVXXKMXXX) ..... -0.3V to +6.5V
Voltage on any combined analog and digital pin with respect to V_{SS} ..... -0.3V to (V_{DD} + 0.3V)
Voltage on any digital only pin with respect to V_{SS} ..... -0.3V to (V_{DD} + 0.3V)
Voltage on $\overline{MCLR}/V_{PP}$ pin with respect to V_{SS} ..... -0.3V to +9.0V
Maximum current out of V_{SS} pin ..... 300 mA
Maximum current into V_{DD} pin(1) ..... 250 mA
Maximum output current sunk by any I/O pin ..... 25 mA
Maximum output current sourced by any I/O pin ..... 25 mA
Maximum current sunk by all ports ..... 200 mA
Maximum current sourced by all ports(1) ..... 200 mA

Note 1: Maximum allowable current is a function of device maximum power dissipation (see Table 27-1).

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 27-7: DC CHARACTERISTICS: IDLE CURRENT (IIDLE)

DC CHARACTERISTICS		Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KMXXX) 2.0V to 5.5V (PIC24FV16KMXXX) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Parameter No.	**Device**	**Typical**	**Max**	**Units**	**Conditions**	
Idle Current (IIDLE)						
DC40	PIC24FV16KMXXX	120	200	µA	2.0V	0.5 MIPS, FOSC = 1 MHz(1)
		160	430	µA	5.0V	
	PIC24F16KMXXX	50	100	µA	1.8V	
		90	370	µA	3.3V	
DC42	PIC24FV16KMXXX	165	—	µA	2.0V	1 MIPS, FOSC = 2 MHz(1)
		260	—	µA	5.0V	
	PIC24F16KMXXX	95	—	µA	1.8V	
		180	—	µA	3.3V	
DC44	PIC24FV16KMXXX	3.1	6.5	mA	5.0V	16 MIPS, FOSC = 32 MHz(1)
	PIC24F16KMXXX	2.9	6.0	mA	3.3V	
DC46	PIC24FV16KMXXX	0.65	—	mA	2.0V	FRC (4 MIPS), FOSC = 8 MHz
		1.0	—	mA	5.0V	
	PIC24F16KMXXX	0.55	—	mA	1.8V	
		1.0	—	mA	3.3V	
DC50	PIC24FV16KMXXX	42	200	µA	2.0V	LPRC (15.5 KIPS), FOSC = 31 kHz
		65	225	µA	5.0V	
	PIC24F16KMXXX	2.2	18	µA	1.8V	
		4.0	40	µA	3.3V	

Legend: Unshaded rows represent PIC24F16KMXXX devices and shaded rows represent PIC24FV16KMXXX devices.

Note 1: The oscillator is in External Clock mode (FOSCSEL<2:0> = 010, FOSC<1:0> = 00).

20-Lead Plastic Small Outline (SO) - Wide, 7.50 mm Body [SOIC]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging
