Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	1000
Number of Logic Elements/Cells	8000
Total RAM Bits	226304
Number of I/O	201
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FTBGA (17x17)

LatticeXP2 Family Data Sheet Introduction

February 2012 **Data Sheet DS1009**

Features

- **flexiFLASH™ Architecture**
  - Instant-on
  - Infinitely reconfigurable
  - Single chip
  - FlashBAK™ technology
  - Serial TAG memory
  - Design security
- **Live Update Technology**
  - TransFR™ technology
  - Secure updates with 128 bit AES encryption
  - Dual-boot with external SPI
- **sysDSP™ Block**
  - Three to eight blocks for high performance Multiply and Accumulate
  - 12 to 32 18x18 multipliers
  - Each block supports one 36x36 multiplier or four 18x18 or eight 9x9 multipliers
- **Embedded and Distributed Memory**
  - Up to 885 Kbits sysMEM™ EBR
  - Up to 83 Kbits Distributed RAM
- **sysCLOCK™ PLLs**
  - Up to four analog PLLs per device
  - Clock multiply, divide and phase shifting
- **Flexible I/O Buffer**
  - sysIO™ buffer supports:
    - LVCMOS 33/25/18/15/12; LVTTL
    - SSTL 33/25/18 class I, II
    - HSTL15 class I; HSTL18 class I, II
    - PCI
    - LVDS, Bus-LVDS, MLVDS, LVPECL, RSDS
- **Pre-engineered Source Synchronous Interfaces**
  - DDR / DDR2 interfaces up to 200 MHz
  - 7:1 LVDS interfaces support display applications
  - XGMII
- **Density And Package Options**
  - 5k to 40k LUT4s, 86 to 540 I/Os
  - csBGA, TQFP, PQFP, ftBGA and fpBGA packages
  - Density migration supported
- **Flexible Device Configuration**
  - SPI (master and slave) Boot Flash Interface
  - Dual Boot Image supported
  - Soft Error Detect (SED) macro embedded
- **System Level Support**
  - IEEE 1149.1 and IEEE 1532 Compliant
  - On-chip oscillator for initialization & general use
  - Devices operate with 1.2V power supply

Table 1-1. LatticeXP2 Family Selection Guide

Device	**XP2-5**	**XP2-8**	**XP2-17**	**XP2-30**	**XP2-40**
LUTs (K)	5	8	17	29	40
Distributed RAM (KBits)	10	18	35	56	83
EBR SRAM (KBits)	166	221	276	387	885
EBR SRAM Blocks	9	12	15	21	48
sysDSP Blocks	3	4	5	7	8
18 x 18 Multipliers	12	16	20	28	32

GPLL	2	2	4	4	4
Max Available I/O	172	201	358	472	540
Packages and I/O Combinations					
132-Ball csBGA (8 x 8 mm)	86	86			
144-Pin TQFP (20 x 20 mm)	100	100			
208-Pin PQFP (28 x 28 mm)	146	146	146		
256-Ball ftBGA (17 x17 mm)	172	201	201	201	
484-Ball fpBGA (23 x 23 mm)			358	363	363
672-Ball fpBGA (27 x 27 mm)				472	540

LatticeXP2 Family Data Sheet
Architecture

August 2014 **Data Sheet DS1009**

Architecture Overview

Each LatticeXP2 device contains an array of logic blocks surrounded by Programmable I/O Cells (PIC). Interspersed between the rows of logic blocks are rows of sysMEM™ Embedded Block RAM (EBR) and a row of sysDSP™ Digital Signal Processing blocks as shown in Figure 2-1.

On the left and right sides of the Programmable Functional Unit (PFU) array, there are Non-volatile Memory Blocks. In configuration mode the nonvolatile memory is programmed via the IEEE 1149.1 TAP port or the sysCONFIG™ peripheral port. On power up, the configuration data is transferred from the Non-volatile Memory Blocks to the configuration SRAM. With this technology, expensive external configuration memory is not required, and designs are secured from unauthorized read-back. This transfer of data from non-volatile memory to configuration SRAM via wide busses happens in microseconds, providing an "instant-on" capability that allows easy interfacing in many applications. LatticeXP2 devices can also transfer data from the sysMEM EBR blocks to the Non-volatile Memory Blocks at user request.

There are two kinds of logic blocks, the PFU and the PFU without RAM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM and ROM functions. The PFF block contains building blocks for logic, arithmetic and ROM functions. Both PFU and PFF blocks are optimized for flexibility allowing complex designs to be implemented quickly and efficiently. Logic Blocks are arranged in a two-dimensional array. Only one type of block is used per row.

LatticeXP2 devices contain one or more rows of sysMEM EBR blocks. sysMEM EBRs are large dedicated 18Kbit memory blocks. Each sysMEM block can be configured in a variety of depths and widths of RAM or ROM. In addition, LatticeXP2 devices contain up to two rows of DSP Blocks. Each DSP block has multipliers and adder/accumulators, which are the building blocks for complex signal processing capabilities.

Each PIC block encompasses two PIOs (PIO pairs) with their respective sysIO buffers. The sysIO buffers of the LatticeXP2 devices are arranged into eight banks, allowing the implementation of a wide variety of I/O standards. PIO pairs on the left and right edges of the device can be configured as LVDS transmit/receive pairs. The PIC logic also includes pre-engineered support to aid in the implementation of high speed source synchronous standards such as 7:1 LVDS interfaces, found in many display applications, and memory interfaces including DDR and DDR2.

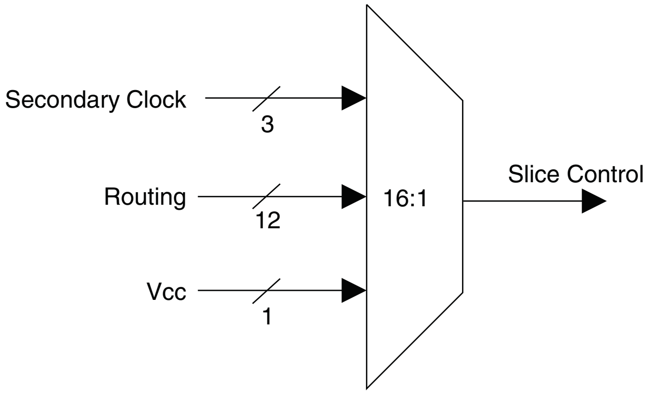
The LatticeXP2 registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

Other blocks provided include PLLs and configuration functions. The LatticeXP2 architecture provides up to four General Purpose PLLs (GPLL) per device. The GPLL blocks are located in the corners of the device.

The configuration block that supports features such as configuration bit-stream de-encryption, transparent updates and dual boot support is located between banks two and three. Every device in the LatticeXP2 family supports a sysCONFIG port, muxed with bank seven I/Os, which supports serial device configuration. A JTAG port is provided between banks two and three.

This family also provides an on-chip oscillator. LatticeXP2 devices use 1.2V as their core voltage.

Figure 2-14. Slice0 through Slice2 Control Selection



Edge Clock Routing

LatticeXP2 devices have eight high-speed edge clocks that are intended for use with the PIOs in the implementation of high-speed interfaces. Each device has two edge clocks per edge. Figure 2-15 shows the selection muxes for these clocks.

Figure 2-15. Edge Clock Mux Connections

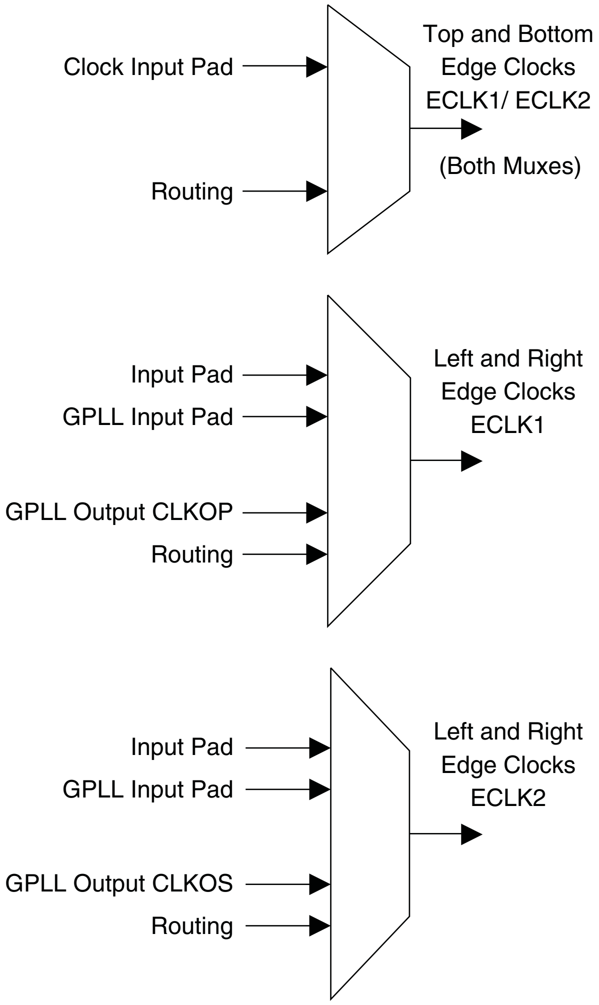


Figure 2-16. FlashBAK Technology

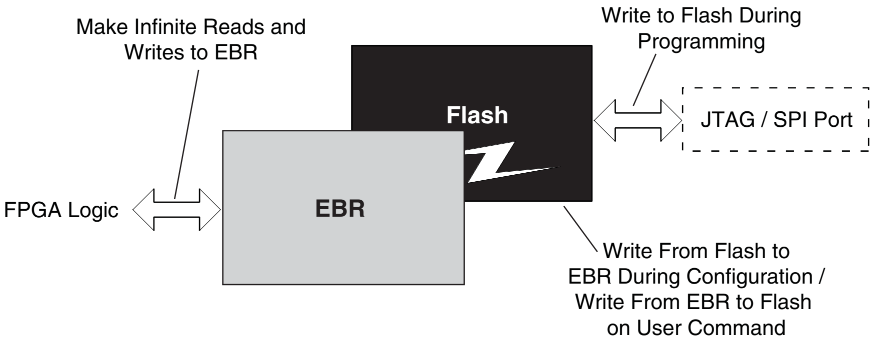


Memory Cascading

Larger and deeper blocks of RAMs can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual and Pseudo-Dual Port Modes

In all the sysMEM RAM modes the input data and address for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the output.

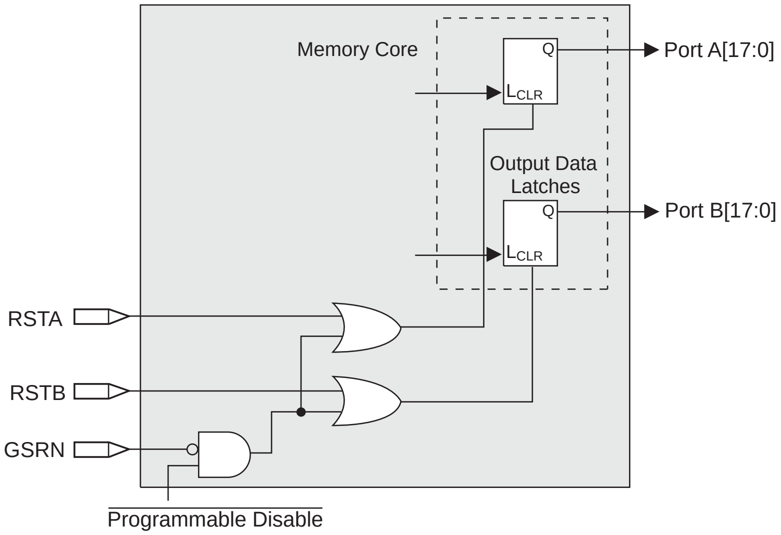
EBR memory supports two forms of write behavior for single port or dual port operation:

1. Normal – Data on the output appears only during a read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
2. Write Through – A copy of the input data appears at the output of the same port during a write cycle. This mode is supported for all data widths.

Memory Core Reset

The memory array in the EBR utilizes latches at the A and B output ports. These latches can be reset asynchronously or synchronously. RSTA and RSTB are local signals, which reset the output latches associated with Port A and Port B respectively. GSRN, the global reset signal, resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-17.

Figure 2-17. Memory Core Reset

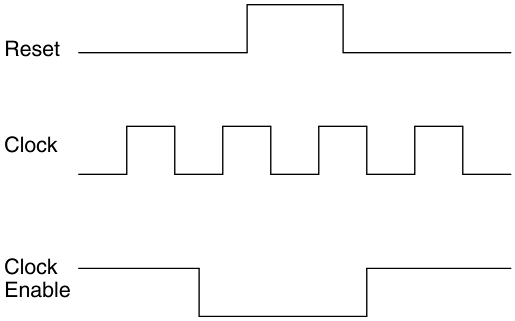


For further information on the sysMEM EBR block, please see TN1137, LatticeXP2 Memory Usage Guide.

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the low-to-high transition of the reset signal, as shown in Figure 2-18. The GSR input to the EBR is always asynchronous.

Figure 2-18. EBR Asynchronous Reset (Including GSR) Timing Diagram



If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM and ROM implementations.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

sysDSP™ Block

The LatticeXP2 family provides a sysDSP block making it ideally suited for low cost, high performance Digital Signal Processing (DSP) applications. Typical functions used in these applications include Bit Correlators, Fast Fourier Transform (FFT) functions, Finite Impulse Response (FIR) Filter, Reed-Solomon Encoder/Decoder, Turbo Encoder/Decoder and Convolutional Encoder/Decoder. These complex signal processing functions use similar building blocks such as multiply-adders and multiply-accumulators.

sysDSP Block Approach Compare to General DSP

Conventional general-purpose DSP chips typically contain one to four (Multiply and Accumulate) MAC units with fixed data-width multipliers; this leads to limited parallelism and limited throughput. Their throughput is increased by higher clock speeds. The LatticeXP2 family, on the other hand, has many DSP blocks that support different data-widths. This allows the designer to use highly parallel implementations of DSP functions. The designer can optimize the DSP performance vs. area by choosing appropriate levels of parallelism. Figure 2-19 compares the fully serial and the mixed parallel and serial implementations.

original backup configuration and try again. This all can be done without power cycling the system. For more information please see TN1220, LatticeXP2 Dual Boot Feature.

For more information on device configuration, please see TN1141, LatticeXP2 sysCONFIG Usage Guide.

Soft Error Detect (SED) Support

LatticeXP2 devices have dedicated logic to perform Cyclic Redundancy Code (CRC) checks. During configuration, the configuration data bitstream can be checked with the CRC logic block. In addition, LatticeXP2 devices can be programmed for checking soft errors in SRAM. SED can be run on a programmed device when the user logic is not active. In the event a soft error occurs, the device can be programmed to either reload from a known good boot image (from internal Flash or external SPI memory) or generate an error signal.

For further information on SED support, please see TN1130, LatticeXP2 Soft Error Detection (SED) Usage Guide.

On-Chip Oscillator

Every LatticeXP2 device has an internal CMOS oscillator that is used to derive a Master Clock (CCLK) for configuration. The oscillator and CCLK run continuously and are available to user logic after configuration is complete. The available CCLK frequencies are listed in Table 2-14. When a different CCLK frequency is selected during the design process, the following sequence takes place:

1. Device powers up with the default CCLK frequency.
2. During configuration, users select a different CCLK frequency.
3. CCLK frequency changes to the selected frequency after clock configuration bits are received.

This internal CMOS oscillator is available to the user by routing it as an input clock to the clock tree. For further information on the use of this oscillator for configuration or user mode, please see TN1141, LatticeXP2 sysCONFIG Usage Guide.

Density Shifting

The LatticeXP2 family is designed to ensure that different density devices in the same family and in the same package have the same pinout. Furthermore, the architecture ensures a high success rate when performing design migration from lower density devices to higher density devices. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

Programming and Erase Flash Supply Current[1, 2, 3, 4, 5]

Over Recommended Operating Conditions

Symbol	Parameter	Device	Typical (25°C, Max. Supply)[6]	Units
I_{CC}	Core Power Supply Current	XP2-5	17	mA
		XP2-8	21	mA
		XP2-17	28	mA
		XP2-30	36	mA
		XP2-40	50	mA
I_{CCAUX}	Auxiliary Power Supply Current[7]	XP2-5	64	mA
		XP2-8	66	mA
		XP2-17	83	mA
		XP2-30	87	mA
		XP2-40	88	mA
I_{CCPLL}	PLL Power Supply Current (per PLL)		0.1	mA
I_{CCIO}	Bank Power Supply Current (per Bank)		5	mA
I_{CCJ}	V_{CCJ} Power Supply Current[8]		14	mA

1. For further information on supply current, please see TN1139, Power Estimation and Management for LatticeXP2 Devices.
2. Assumes all outputs are tristated, all inputs are configured as LVCMOS and held at the V_{CCIO} or GND.
3. Frequency 0 MHz (excludes dynamic power from FPGA operation).
4. A specific configuration pattern is used that scales with the size of the device; consists of 75% PFU utilization, 50% EBR, and 25% I/O configuration.
5. Bypass or decoupling capacitor across the supply.
6. T_J = 25°C, power supplies at nominal voltage.
7. In fpBGA and ftBGA packages the PLLs are connected to and powered from the auxiliary power supply. For these packages, the actual auxiliary supply current is the sum of I_{CCAUX} and I_{CCPLL}. For csBGA, PQFP and TQFP packages the PLLs are powered independent of the auxiliary power supply.
8. When programming via JTAG.

I_{SAB}	Output Short Circuit Current	V_{OD} = 0V Driver Outputs Shorted to Each Other	—	—	12	mA

Differential HSTL and SSTL

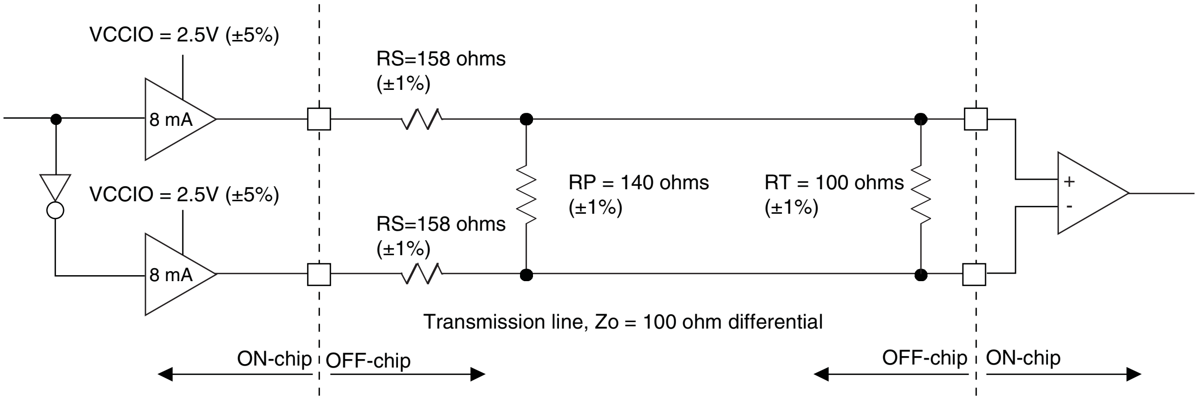
Differential HSTL and SSTL outputs are implemented as a pair of complementary single-ended outputs. All allowable single-ended output classes (class I and class II) are supported in this mode.

For further information on LVPECL, RSDS, MLVDS, BLVDS and other differential interfaces please see details in additional technical notes listed at the end of this data sheet.

LVDS25E

The top and bottom sides of LatticeXP2 devices support LVDS outputs via emulated complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The scheme shown in Figure 3-1 is one possible solution for point-to-point signals.

Figure 3-1. LVDS25E Output Termination Example



BLVDS

The LatticeXP2 devices support the BLVDS standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel external resistor across the driver outputs. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

Figure 3-2. BLVDS Multi-point Output Example

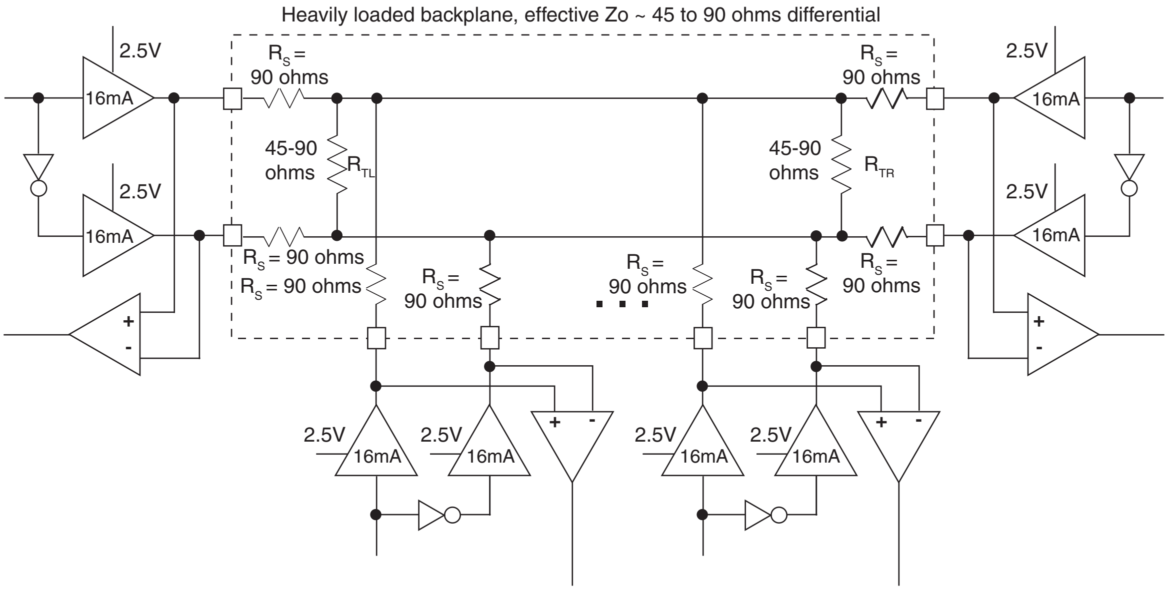


Table 3-2. BLVDS DC Conditions[1]

Over Recommended Operating Conditions

Parameter	Description	Typical		Units
		Zo = 45Ω	Zo = 90Ω	
V_{CCIO}	Output Driver Supply (+/- 5%)	2.50	2.50	V
Z_{OUT}	Driver Impedance	10.00	10.00	Ω
R_S	Driver Series Resistor (+/- 1%)	90.00	90.00	Ω
R_{TL}	Driver Parallel Resistor (+/- 1%)	45.00	90.00	Ω
R_{TR}	Receiver Termination (+/- 1%)	45.00	90.00	Ω
V_{OH}	Output High Voltage (After R_{TL})	1.38	1.48	V
V_{OL}	Output Low Voltage (After R_{TL})	1.12	1.02	V
V_{OD}	Output Differential Voltage (After R_{TL})	0.25	0.46	V
V_{CM}	Output Common Mode Voltage	1.25	1.25	V
I_{DC}	DC Output Current	11.24	10.20	mA

1. For input buffer, see LVDS table.

RSDS

The LatticeXP2 devices support differential RSDS standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The RSDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

Figure 3-4. RSDS (Reduced Swing Differential Standard)

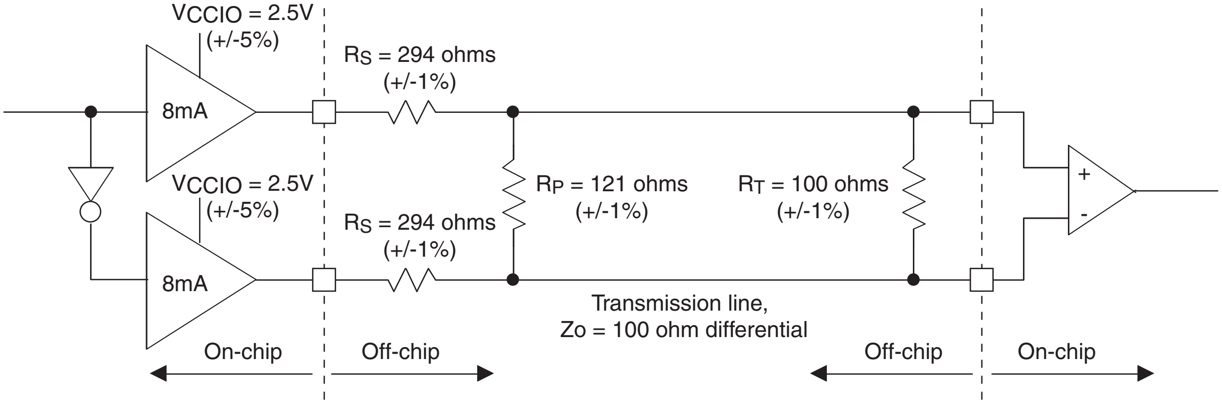

Table 3-4. RSDS DC Conditions[1]

Over Recommended Operating Conditions

Parameter	Description	Typical	Units
V_{CCIO}	Output Driver Supply (+/-5%)	2.50	V
Z_{OUT}	Driver Impedance	20	Ω
R_S	Driver Series Resistor (+/-1%)	294	Ω
R_P	Driver Parallel Resistor (+/-1%)	121	Ω
R_T	Receiver Termination (+/-1%)	100	Ω
V_{OH}	Output High Voltage (After R_P)	1.35	V
V_{OL}	Output Low Voltage (After R_P)	1.15	V
V_{OD}	Output Differential Voltage (After R_P)	0.20	V
V_{CM}	Output Common Mode Voltage	1.25	V
Z_{BACK}	Back Impedance	101.5	Ω
I_{DC}	DC Output Current	3.66	mA

1. For input buffer, see LVDS table.

MLVDS

The LatticeXP2 devices support the differential MLVDS standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The MLVDS input standard is supported by the LVDS differential input buffer. The scheme shown in Figure 3-5 is one possible solution for MLVDS standard implementation. Resistor values in Figure 3-5 are industry standard values for 1% resistors.

Figure 3-5. MLVDS (Reduced Swing Differential Standard)

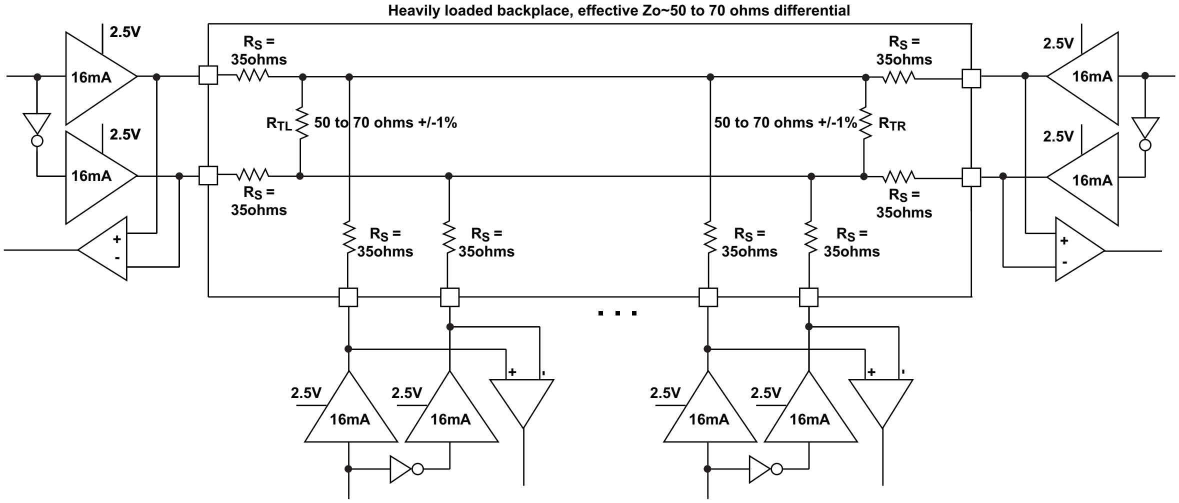

Table 3-5. MLVDS DC Conditions[1]

Parameter	Description	Typical		Units
		Zo=50Ω	Zo=70Ω	
V_{CCIO}	Output Driver Supply (+/-5%)	2.50	2.50	V

Primary Clock									
f_{MAX_PRI}	Frequency for Primary Clock Tree	XP2	—	420	—	357	—	311	MHz
t_{W_PRI}	Clock Pulse Width for Primary Clock	XP2	1	—	1	—	1	—	ns
t_{SKEW_PRI}	Primary Clock Skew Within a Bank	XP2	—	160	—	160	—	160	ps
Edge Clock (ECLK1 and ECLK2)									
f_{MAX_ECLK}	Frequency for Edge Clock	XP2	—	420	—	357	—	311	MHz
t_{W_ECLK}	Clock Pulse Width for Edge Clock	XP2	1	—	1	—	1	—	ns
t_{SKEW_ECLK}	Edge Clock Skew Within an Edge of the Device	XP2	—	130	—	130	—	130	ps

1. General timing numbers based on LVCMOS 2.5, 12mA, 0pf load.
2. DDR timing numbers based on SSTL25.
3. DDR2 timing numbers based on SSTL18.

LatticeXP2 Internal Switching Characteristics[1] (Continued)

Over Recommended Operating Conditions

Parameter	Description	-7		-6		-5		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
t_{HP_DSP}	Pipeline Register Hold Time	-0.787	—	-0.890	—	-0.994	—	ns
t_{SUO_DSP}	Output Register Setup Time	4.896	—	5.413	—	5.931	—	ns
t_{HO_DSP}	Output Register Hold Time	-1.439	—	-1.604	—	-1.770	—	ns
t_{COI_DSP}[3]	Input Register Clock to Output Time	—	4.513	—	4.947	—	5.382	ns
t_{COP_DSP}[3]	Pipeline Register Clock to Output Time	—	2.153	—	2.272	—	2.391	ns
t_{COO_DSP}[3]	Output Register Clock to Output Time	—	0.569	—	0.600	—	0.631	ns
$t_{SUADSUB}$	AdSub Input Register Setup Time	-0.270	—	-0.298	—	-0.327	—	ns
t_{HADSUB}	AdSub Input Register Hold Time	0.306	—	0.338	—	0.371	—	ns

1. Internal parameters are characterized, but not tested on every device.
2. RST resets VCO and all counters in PLL.
3. These parameters include the Adder Subtractor block in the path.

LatticeXP2 Family Timing Adders[1, 2, 3, 4]

Over Recommended Operating Conditions

Buffer Type	Description	-7	-6	-5	Units
Input Adjusters					
LVDS25	LVDS	-0.26	-0.11	0.04	ns
BLVDS25	BLVDS	-0.26	-0.11	0.04	ns

LatticeXP2 Family Data Sheet Revision History

September 2014 **Data Sheet DS1009**

Revision History

Date	Version	Section	Change Summary
May 2007	01.1	—	Initial release.
September 2007	01.2	DC and Switching Characteristics	Added JTAG Port Timing Waveforms diagram.
			Updated sysCLOCK PLL Timing table.
		Pinout Information	Added Thermal Management text section.
February 2008	01.3	Architecture	Added LVCMOS33D to Supported Output Standards table.
			Clarified: “This Flash can be programmed through either the JTAG or Slave SPI ports of the device. The SRAM configuration space can also be infinitely reconfigured through the JTAG and Master SPI ports.”
			Added External Slave SPI Port to Serial TAG Memory section. Updated Serial TAG Memory diagram.
		DC and Switching Characteristics	Updated Flash Programming Specifications table.
			Added “8W” specification to Hot Socketing Specifications table.
			Updated Timing Tables
			Clarifications for IIH in DC Electrical Characteristics table.
			Added LVCMOS33D section
			Updated DOA and DOA (Regs) to EBR Timing diagrams.
			Removed Master Clock Frequency and Duty Cycle sections from the LatticeXP2 sysCONFIG Port Timing Specifications table. These are listed on the On-chip Oscillator and Configuration Master Clock Characteristics table.
			Changed CSSPIN to CSSPISN in description of t_{SCS}, t_{SCSS}, and t_{SCSH} parameters. Removed t_{SOE} parameter.
			Clarified On-chip Oscillator documentation
			Added Switching Test Conditions
		Pinout Information	Added “True LVDS Pairs Bonding Out per Bank,” “DDR Banks Bonding Out per I/O Bank,” and “PCI capable I/Os Bonding Out per Bank” to Pin Information Summary in place of previous blank table “PCI and DDR Capabilities of the Device-Package Combinations”
			Removed pinout listing. This information is available on the LatticeXP2 product web pages
		Ordering Information	Added XP2-17 “8W” and all other family OPNs.
April 2008	01.4	DC and Switching Characteristics	Updated Absolute Maximum Ratings footnotes.
			Updated Recommended Operating Conditions Table footnotes.
			Updated Supply Current (Standby) Table
			Updated Initialization Supply Current Table
			Updated Programming and Erase Flash Supply Current Table
			Updated Register to Register Performance Table
			Updated LatticeXP2 External Switching Characteristics Table
			Updated LatticeXP2 Internal Switching Characteristics Table
			Updated sysCLOCK PLL Timing Table
