Microchip Technology - DSPIC33EP16GS202-E/SS Datasheet

Welcome to E-XFL.COM

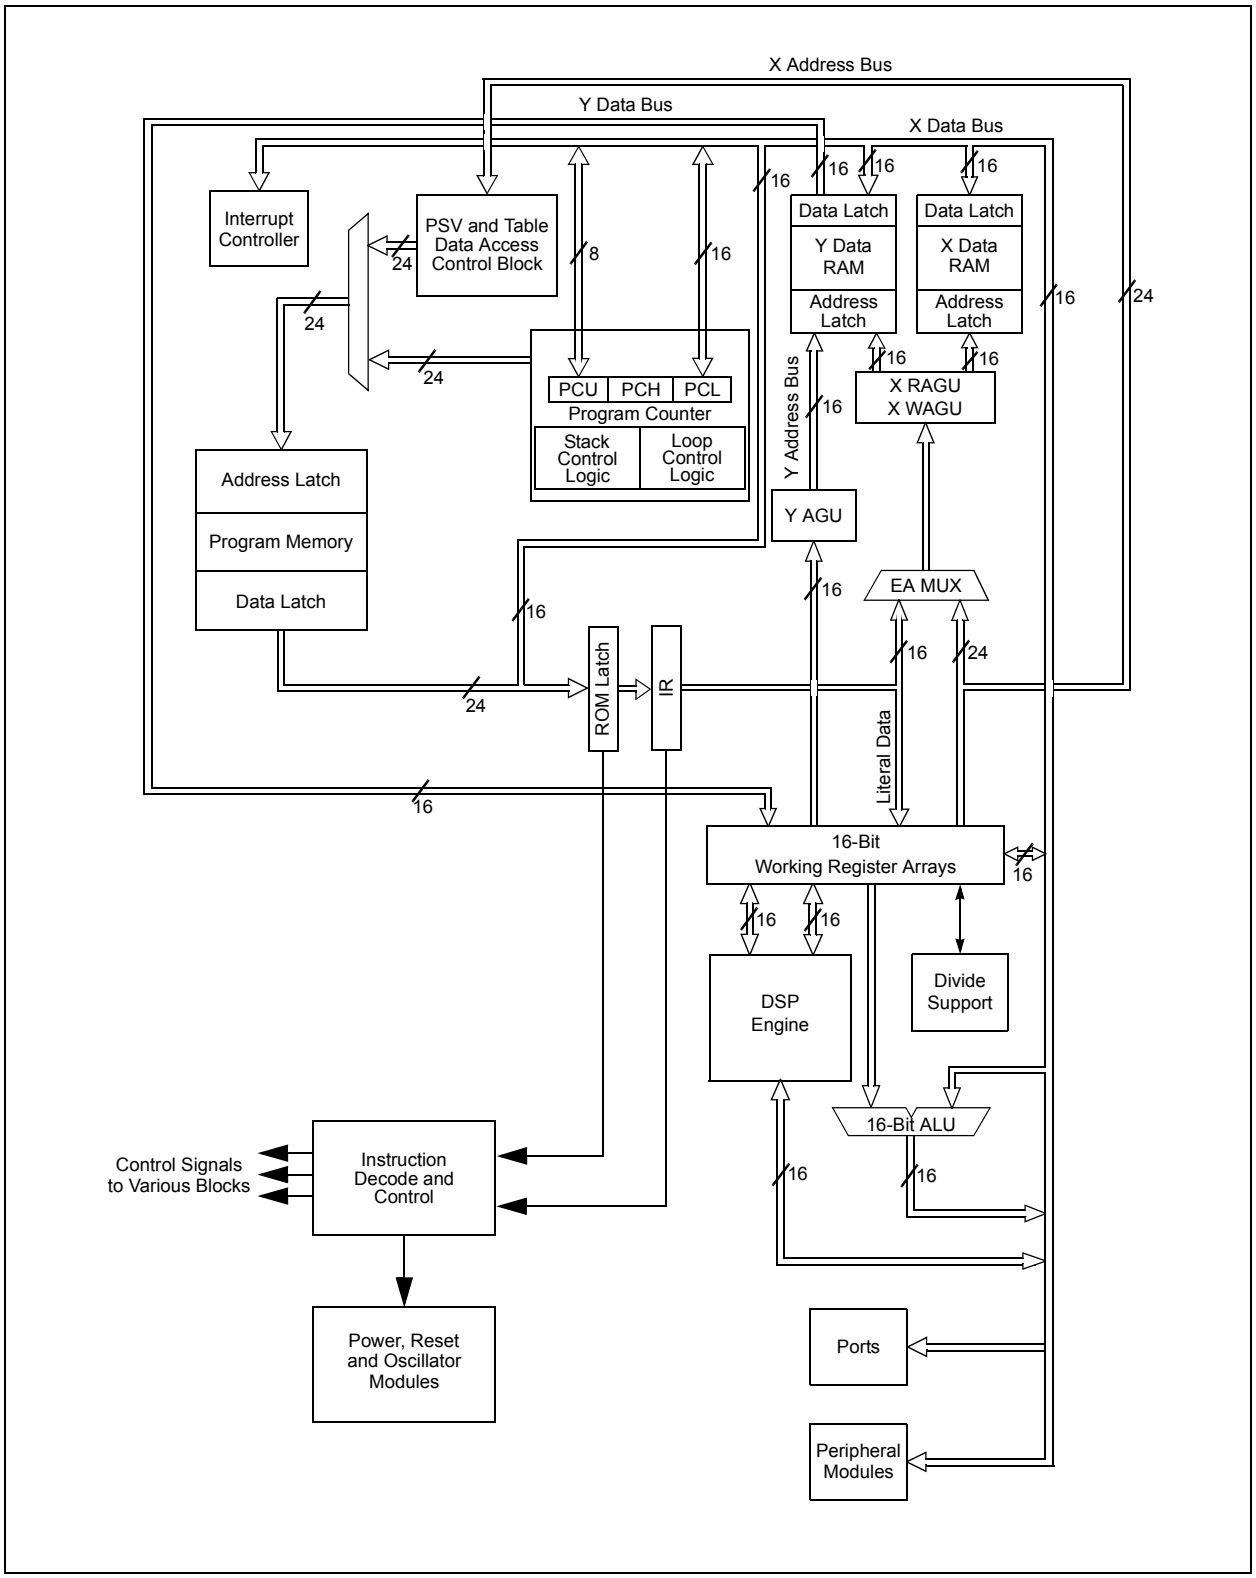
What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	60 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	21
Program Memory Size	16KB (16K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 12x12b; D/A 2x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C
Mounting Type	Surface Mount
Package / Case	28-SSOP (0.209", 5.30mm Width)
Supplier Device Package	28-SSOP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33ep16gs202-e-ss

FIGURE 3-1: dsPIC33EPXXGS202 CPU BLOCK DIAGRAM



3.5 Programmer's Model

The programmer's model for the dsPIC33EPXXGS202 family is shown in Figure 3-2. All registers in the programmer's model are memory-mapped and can be manipulated directly by instructions. Table 3-1 lists a description of each register.

In addition to the registers contained in the programmer's model, the dsPIC33EPXXGS202 devices contain control registers for Modulo Addressing, Bit-Reversed Addressing and interrupts. These registers are described in subsequent sections of this document.

All registers associated with the programmer's model are memory-mapped, as shown in Table 3-1.

TABLE 3-1: PROGRAMMER'S MODEL REGISTER DESCRIPTIONS

Register(s) Name	Description
W0 through W15(1)	Working Register Array
W0 through W14(1)	Alternate Working Register Array 1
W0 through W14(1)	Alternate Working Register Array 2
ACCA, ACCB	40-Bit DSP Accumulators
PC	23-Bit Program Counter
SR	ALU and DSP Engine STATUS Register
SPLIM	Stack Pointer Limit Value Register
TBLPAG	Table Memory Page Address Register
DSRPAG	Extended Data Space (EDS) Read Page Register
RCOUNT	REPEAT Loop Counter Register
DCOUNT	DO Loop Counter Register
DOSTARTH(2), DOSTARTL(2)	DO Loop Start Address Register (High and Low)
DOENDH, DOENDL	DO Loop End Address Register (High and Low)
CORCON	Contains DSP Engine, DO Loop Control and Trap Status bits

Note 1: Memory-mapped W0 through W14 represents the value of the register in the currently active CPU context.

2: The DOSTARTH and DOSTARTL registers are read-only.

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the dsPIC33EPXXGS202 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"dsPIC33E/PIC24E Program Memory"** (DS70000613) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

The dsPIC33EPXXGS202 family architecture features separate program and data memory spaces, and buses. This architecture also allows the direct access of program memory from the Data Space (DS) during code execution.

4.1 Program Address Space

The program address memory space of the dsPIC33EPXXGS202 family devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit PC during program execution, or from table operation or Data Space remapping, as described in **Section 4.9 "Interfacing Program and Data Memory Spaces"**.

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFF). The exception is the use of TBLRD operations, which use TBLPAG to permit access to calibration data and Device ID sections of the configuration memory space.

The program memory maps for the dsPIC33EP16/32GS202 devices are shown in Figure 4-1 and Figure 4-2.

4.2 Unique Device Identifier (UDID)

All dsPIC33EPXXGS202 family devices are individually encoded during final manufacturing with a Unique Device Identifier or UDID. This feature allows for manufacturing traceability of Microchip Technology devices in applications where this is a requirement. It may also be used by the application manufacturer for any number of things that may require unique identification, such as:

- Tracking the device
- Unique serial number
- Unique security key

The UDID comprises five 24-bit program words. When taken together, these fields form a unique 120-bit identifier.

The UDID is stored in five read-only locations, located between 800F00h and 800F08h in the device configuration space. Table 4-1 lists the addresses of the Identifier Words and shows their contents.

TABLE 4-1: UDID ADDRESSES

Name	Address	Bits 23:16	Bits 15:8	Bits 7:0
UDID1	800F00	UDID Word 1		
UDID2	800F02	UDID Word 2		
UDID3	800F04	UDID Word 3		
UDID4	800F06	UDID Word 4		
UDID5	800F08	UDID Word 5

REGISTER 6-1: RCON: RESET CONTROL REGISTER(1) (CONTINUED)

bit 3 **SLEEP:** Wake-up from Sleep Flag bit
1 = Device has been in Sleep mode
0 = Device has not been in Sleep mode

bit 2 **IDLE:** Wake-up from Idle Flag bit
1 = Device has been in Idle mode
0 = Device has not been in Idle mode

bit 1 **BOR:** Brown-out Reset Flag bit
1 = A Brown-out Reset has occurred
0 = A Brown-out Reset has not occurred

bit 0 **POR:** Power-on Reset Flag bit
1 = A Power-on Reset has occurred
0 = A Power-on Reset has not occurred

Note 1: All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

2: If the WDTEN<1:0> Configuration bits are '11' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

8.1 CPU Clocking System

The dsPIC33EPXXGS202 family of devices provides six system clock options:

- Fast RC (FRC) Oscillator
- FRC Oscillator with Phase-Locked Loop (PLL)
- FRC Oscillator with Postscaler
- Primary (XT, HS or EC) Oscillator
- Primary Oscillator with PLL
- Low-Power RC (LPRC) Oscillator

Instruction execution speed or device operating frequency, FCY, is given by Equation 8-1.

EQUATION 8-1: DEVICE OPERATING FREQUENCY

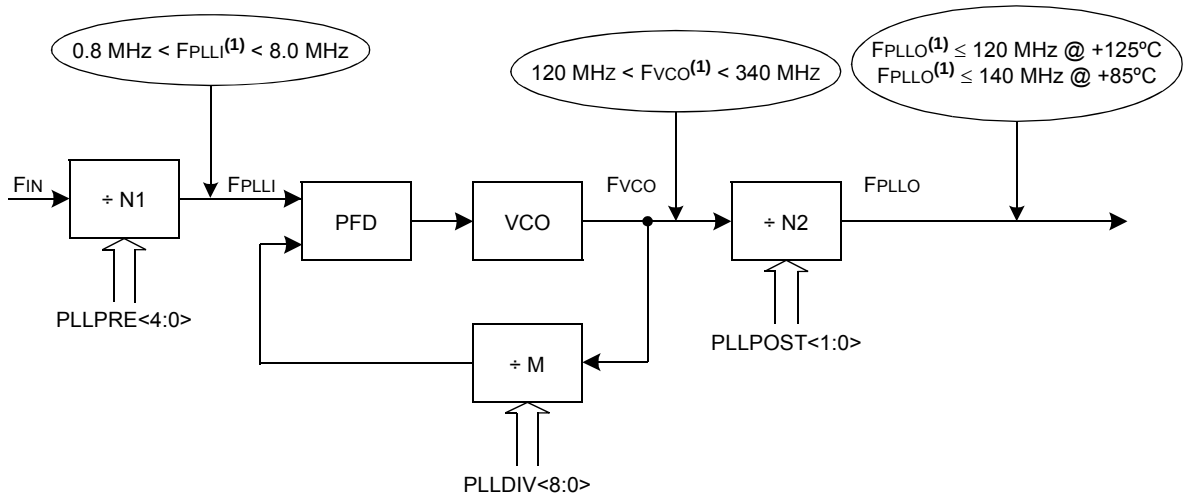
$$FCY = FOSC/2$$

Figure 8-2 is a block diagram of the PLL module.

Equation 8-2 provides the relationship between input frequency (FIN) and output frequency (FPLLO).

Equation 8-3 provides the relationship between input frequency (FIN) and VCO frequency (FVCO).

FIGURE 8-2: PLL BLOCK DIAGRAM



Note 1: This frequency range must be met at all times.

EQUATION 8-2: FPLLO CALCULATION

$$FPLLO = FIN \times \left(\frac{M}{N1 \times N2}\right) = FIN \times \left(\frac{(PLLDIV<8:0> + 2)}{(PLLPRE<4:0> + 2) \times 2(PLLPOST<1:0> + 1)}\right)$$

Where:

$N1 = PLLPRE<4:0> + 2$

$N2 = 2 \text{ x } (PLLPOST<1:0> + 1)$

$M = PLLDIV<8:0> + 2$

EQUATION 8-3: FVCO CALCULATION

$$FVCO = FIN \times \left(\frac{M}{N1}\right) = FIN \times \left(\frac{(PLLDIV<8:0> + 2)}{(PLLPRE<4:0> + 2)}\right)$$

REGISTER 10-3: RPINR2: PERIPHERAL PIN SELECT INPUT REGISTER 2

bit 15-3 **Unimplemented:** Read as '0'

bit 2-0 **PCLKDIV<2:0>:** PWM Input Clock Prescaler (Divider) Select bits(1)

111 = Reserved
110 = Divide-by-64, maximum PWM timing resolution
101 = Divide-by-32, maximum PWM timing resolution
100 = Divide-by-16, maximum PWM timing resolution
011 = Divide-by-8, maximum PWM timing resolution
010 = Divide-by-4, maximum PWM timing resolution
001 = Divide-by-2, maximum PWM timing resolution
000 = Divide-by-1, maximum PWM timing resolution (power-on default)

Note 1: These bits should be changed only when PTEN = 0. Changing the clock selection during operation will yield unpredictable results.

REGISTER 15-7: STPER: PWM SECONDARY MASTER TIME BASE PERIOD REGISTER(1,2)

R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1
STPER<15:8>							
bit 15							bit 8

R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1
STPER<7:0>							
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-0 **STPER<15:0>:** Secondary Master Time Base (SMTMR) Period Value bits

Note 1: The PWM time base has a minimum value of 0x0010 and a maximum value of 0xFFF8.

2: Any period value that is less than 0x0028 must have the Least Significant 3 bits set to '0', thus yielding a period resolution at 8.32 ns (at fastest auxiliary clock rate).

17.0 INTER-INTEGRATED CIRCUIT (I^2C)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXGS202 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Inter-Integrated Circuit™ (I^2C™)"** (DS70000195) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXGS202 family of devices contains one Inter-Integrated Circuit (I^2C) module.

The I^2C module provides complete hardware support for both Slave and Multi-Master modes of the I^2C serial communication standard, with a 16-bit interface.

The I^2C module has a 2-pin interface:

- The SCL1 pin is clock
- The SDA1 pin is data

The I^2C module offers the following key features:

- I^2C Interface Supporting Both Master and Slave modes of Operation
- I^2C Slave mode Supports 7 and 10-Bit Addressing
- I^2C Master mode Supports 7 and 10-Bit Addressing
- I^2C Port allows Bidirectional Transfers between Master and Slaves
- Serial Clock Synchronization for I^2C Port can be used as a Handshake Mechanism to Suspend and Resume Serial Transfer (SCLREL control)
- I^2C Supports Multi-Master Operation, Detects Bus Collision and Arbitrates Accordingly
- System Management Bus (SMBus) Support

17.1 I^2C Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page contains the latest updates and additional information.

17.1.1 KEY RESOURCES

bit 15 **UARTEN:** UART1 Enable bit(1)
- 1 = UART1 is enabled; all UART1 pins are controlled by UART1, as defined by UEN<1:0>
- 0 = UART1 is disabled; all UART1 pins are controlled by PORT latches; UART1 power consumption is minimal

bit 14 **Unimplemented:** Read as '0'

bit 13 **USIDL:** UART1 Stop in Idle Mode bit
- 1 = Discontinues module operation when device enters Idle mode
- 0 = Continues module operation in Idle mode

bit 12 **IREN:** IrDA® Encoder and Decoder Enable bit(2)
- 1 = IrDA encoder and decoder are enabled
- 0 = IrDA encoder and decoder are disabled

bit 11 **RTSMD:** Mode Selection for $\overline{\text{U1RTS}}$ Pin bit
- 1 = $\overline{\text{U1RTS}}$ pin is in Simplex mode
- 0 = $\overline{\text{U1RTS}}$ pin is in Flow Control mode

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **UEN<1:0>:** UART1 Pin Enable bits
- 11 = U1TX, U1RX and BCLK1 pins are enabled and used; $\overline{\text{U1CTS}}$ pin is controlled by PORT latches
- 10 = U1TX, U1RX, $\overline{\text{U1CTS}}$ and $\overline{\text{U1RTS}}$ pins are enabled and used
- 01 = U1TX, U1RX and $\overline{\text{U1RTS}}$ pins are enabled and used; $\overline{\text{U1CTS}}$ pin is controlled by PORT latches
- 00 = U1TX and U1RX pins are enabled and used; $\overline{\text{U1CTS}}$ and $\overline{\text{U1RTS}}$/BCLK1 pins are controlled by PORT latches

bit 7 **WAKE:** Wake-up on Start bit Detect During Sleep Mode Enable bit
- 1 = UART1 continues to sample the U1RX pin, interrupt is generated on the falling edge; bit is cleared in hardware on the following rising edge
- 0 = No wake-up is enabled

bit 6 **LPBACK:** UART1 Loopback Mode Select bit
- 1 = Enables Loopback mode
- 0 = Loopback mode is disabled

bit 5 **ABAUD:** Auto-Baud Enable bit
- 1 = Enables baud rate measurement on the next character – requires reception of a Sync field (55h) before other data; cleared in hardware upon completion
- 0 = Baud rate measurement is disabled or completed

Note 1: Refer to **"Universal Asynchronous Receiver Transmitter (UART)"** (DS70000582) in the *"dsPIC33/PIC24 Family Reference Manual"* for information on enabling the UART1 module for receive or transmit operation.

2: This feature is only available for the 16x BRG mode (BRGH = 0).

19.0 HIGH-SPEED, 12-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXGS202 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"12-Bit High-Speed, Multiple SARs A/D Converter (ADC)**" (DS70005213) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXGS202 devices have a high-speed, 12-bit Analog-to-Digital Converter (ADC) that features a low conversion latency, high resolution and oversampling capabilities to improve performance in AC/DC, DC/DC power converters.

19.1 Features Overview

The 12-Bit High Speed Multiple SARs Analog-to-Digital Converter (ADC) includes the following features:

- 12-Bit Resolution
- Up to 3.25 Msps Conversion Rate per ADC Core @ 12-Bit Resolution
- Multiple Dedicated ADC Cores
- One Shared (common) ADC Core
- Up to 12 Analog Input Sources
- Conversion Result can be Formatted as Unsigned or Signed Data on a per Channel Basis for All Channels
- Separate 16-Bit Conversion Result Register for each Analog Input
- Simultaneous Sampling of up to 3 Analog Inputs
- Flexible Trigger Options
- Early Interrupt Generation to Enable Fast Processing of Converted Data
- Two Integrated Digital Comparators:
  - Multiple comparison options
  - Assignable to specific analog inputs
- Oversampling Filters:
  - Provides increased resolution
  - Assignable to a specific analog input
- Operation During CPU Sleep and Idle modes

Simplified block diagrams of the Multiple SARs 12-Bit ADC are shown in Figure 19-1, Figure 19-2 and Figure 19-3.

The module consists of two independent SAR ADC cores. The analog inputs (channels) are connected through multiplexers and switches to the Sample-and-Hold (S/H) circuit of each ADC core. The core uses the channel information (the output format, the measurement mode and the input number) to process the analog sample. When conversion is complete, the result is stored in the result buffer for the specific analog input and passed to the digital filter and digital comparator if they were configured to use data from this particular channel.

The ADC module can sample up to three inputs at a time (two inputs from the dedicated SAR ADC cores and one from the shared SAR ADC cores). If multiple ADC inputs request conversion, the ADC module will convert them in a sequential manner, starting with the lowest order input.

The ADC provides each analog input the ability to specify its own trigger source. This capability allows the ADC to sample and convert analog inputs that are associated with PWM generators operating on independent time bases.

21.0 PROGRAMMABLE GAIN AMPLIFIER (PGA)

Note 1: This data sheet summarizes the features of the dsPIC33EPXXGS202 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Programmable Gain Amplifier (PGA)"** (DS70005146) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33EPXXGS202 family devices have two Programmable Gain Amplifiers (PGA1, PGA2). The PGA is an op amp-based, non-inverting amplifier with user-programmable gains. The output of the PGA can be connected to a number of dedicated Sample-and-Hold inputs of the Analog-to-Digital Converter and/or to the high-speed analog comparator module. The PGA has five selectable gains and may be used as a ground referenced amplifier (single-ended) or used with an independent ground reference point.

Key features of the PGA module include:

- Single-Ended or Independent Ground Reference
- Selectable Gains: 4x, 8x, 16x, 32x and 64x
- High Gain Bandwidth
- Rail-to-Rail Output Voltage
- Wide Input Voltage Range

FIGURE 21-1: PGAx MODULE BLOCK DIAGRAM

	CPBNE	CPBNE Wb,Wn,Expr	Compare Wb with Wn, branch if ≠	1	1 (5)	None

Note: Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

25.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the dsPIC33EPXXGS202 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33EPXXGS202 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings(1)

Ambient temperature under bias ..... -40°C to +125°C
Storage temperature ..... -65°C to +150°C
Voltage on V_{DD} with respect to V_{SS} ..... -0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to V_{SS}(3) ..... -0.3V to (V_{DD} + 0.3V)
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} \geq 3.0V$(3) ..... -0.3V to +5.5V
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} < 3.0V$(3) ..... -0.3V to +3.6V
Maximum current out of V_{SS} pin ..... 300 mA
Maximum current into V_{DD} pin(2) ..... 300 mA
Maximum current sunk/sourced by any 4x I/O pin ..... 15 mA
Maximum current sunk/sourced by any 8x I/O pin ..... 25 mA
Maximum current sunk by all ports(2) ..... 200 mA

Note 1: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those, or any other conditions above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see Table 25-2).

3: See the **“Pin Diagrams”** section for the 5V tolerant pins.
