
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

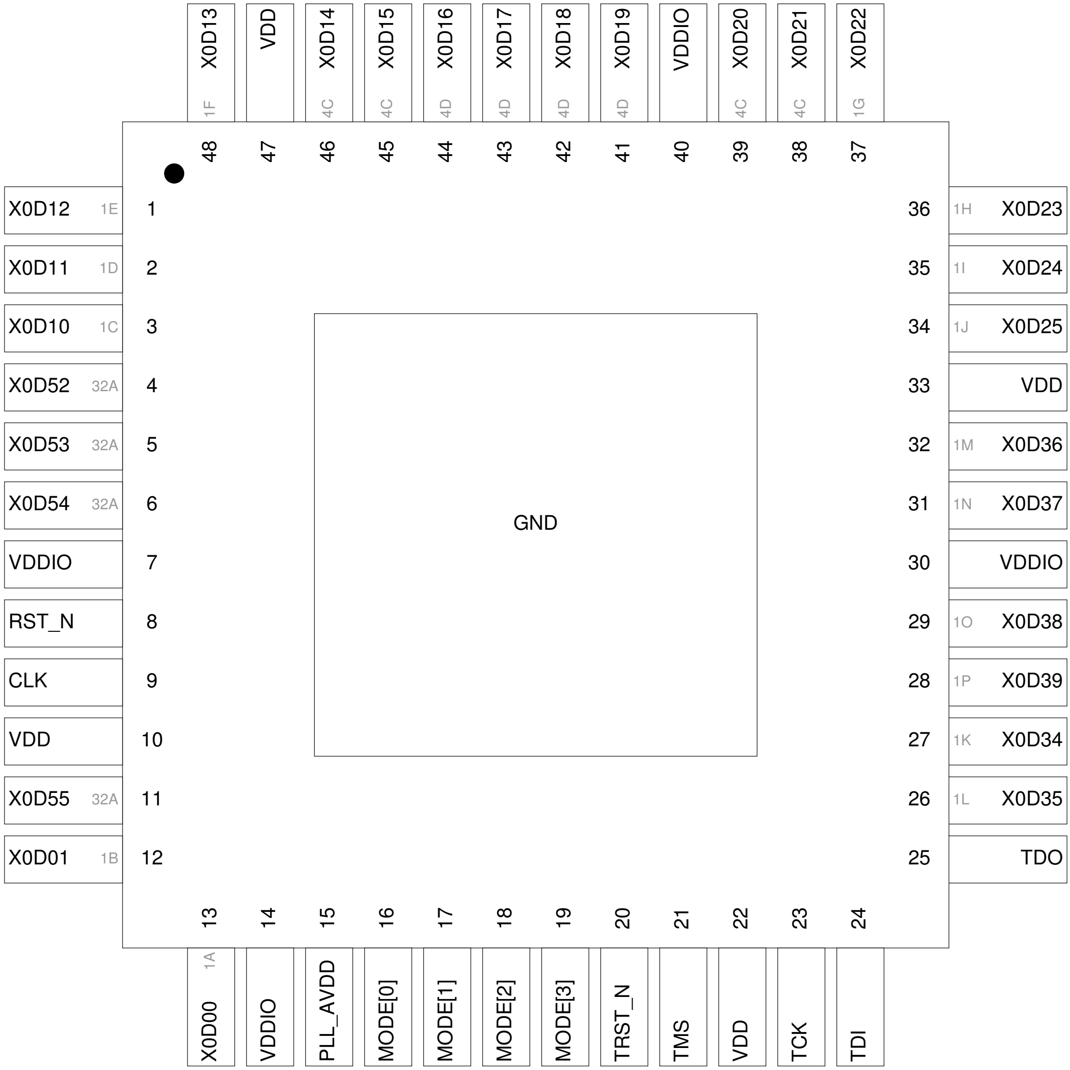
"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	XCore
Core Size	32-Bit 8-Core
Speed	500MIPS
Connectivity	Configurable
Peripherals	-
Number of I/O	28
Program Memory Size	64KB (16K x 32)
Program Memory Type	SRAM
EEPROM Size	-
RAM Size	-
Voltage - Supply (Vcc/Vdd)	0.95V ~ 3.6V
Data Converters	-
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	48-TQFP Exposed Pad
Supplier Device Package	48-TQFP (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/xmos/xs1-l8a-64-tq48-c5

Table of Contents

3 Pin Configuration



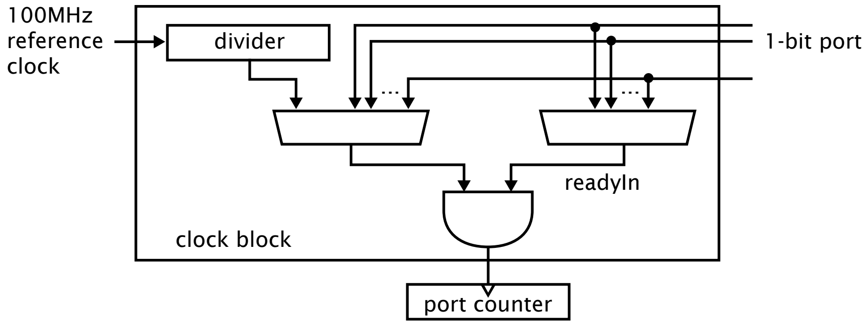


Figure 4: Clock block diagram

In many cases I/O signals are accompanied by strobing signals. The xCORE ports can input and interpret strobe (known as readyIn and readyOut) signals generated by external sources, and ports can generate strobe signals to accompany output data.

On reset, each port is connected to clock block 0, which runs from the xCORE Tile reference clock.

5.5 Channels and Channel Ends

Logical cores communicate using point-to-point connections, formed between two channel ends. A channel-end is a resource on an xCORE tile, that is allocated by the program. Each channel-end has a unique system-wide identifier that comprises a unique number and their tile identifier. Data is transmitted to a channel-end by an output-instruction; and the other side executes an input-instruction. Data can be passed synchronously or asynchronously between the channel ends.

5.6 xCONNECT Switch and Links

XMOS devices provide a scalable architecture, where multiple xCORE devices can be connected together to form one system. Each xCORE device has an xCONNECT interconnect that provides a communication infrastructure for all tasks that run on the various xCORE tiles on the system.

The interconnect relies on a collection of switches and XMOS links. Each xCORE device has an on-chip switch that can set up circuits or route data. The switches are connected by xConnect Links. An XMOS link provides a physical connection between two switches. The switch has a routing algorithm that supports many different topologies, including lines, meshes, trees, and hypercubes.

The links operate in either 2 wires per direction or 5 wires per direction mode, depending on the amount of bandwidth required. Circuit switched, streaming and packet switched data can both be supported efficiently. Streams provide the fastest possible data rates between xCORE Tiles (up to 250 MBit/s), but each stream requires a single link to be reserved between switches on two tiles. All packet communications can be multiplexed onto a single link.

OD, F and R must be chosen so that $0 \leq R \leq 63$, $0 \leq F \leq 4095$, $0 \leq OD \leq 7$, and $260MHz \leq F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \leq 1.3GHz$. The OD, F, and R values can be modified by writing to the digital node PLL configuration register.

The MODE pins must be held at a static value during and after deassertion of the system reset.

If a different tile frequency is required (eg, 500 MHz), then the PLL must be reprogrammed after boot to provide the required tile frequency. The XMOS tools perform this operation by default. Further details on configuring the clock can be found in the XS1-L Clock Frequency Control document, X1433.

7 Boot Procedure

The device is kept in reset by driving RST_N low. When in reset, all GPIO pins are high impedance. When the device is taken out of reset by releasing RST_N the processor starts its internal reset process. After 15-150 μs (depending on the input clock), all GPIO pins have their internal pull-resistor enabled, and the processor boots at a clock speed that depends on MODE0 and MODE1.

The xCORE Tile boot procedure is illustrated in Figure 7. In normal usage, MODE[3:2] controls the boot source according to the table in Figure 8. If bit 5 of the security register (*see* §8.1) is set, the device boots from OTP.

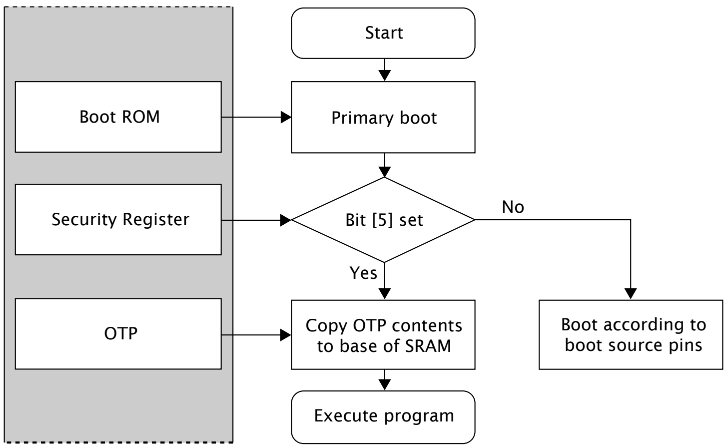

Figure 7: Boot procedure

MODE[3]	MODE[2]	Boot Source
0	0	None: Device waits to be booted via JTAG
0	1	Reserved
1	0	xConnect Link B
1	1	SPI

Figure 8: Boot source pins

The boot image has the following format:

The package is a 48 pin Thin Quad Flat Pack package with exposed heat slug on a 0.5mm pitch. An example land pattern is shown in Figure 14.

For the 48 pin TQFP package, a single square of solder paste, 2.7mm on a side, is recommended - see Figure 15. This gives a paste level of 52%.

10.2 Ground and Thermal Vias

Vias under the heat slug into the ground plane of the PCB are recommended for a low inductance ground connection and good thermal performance. A 3 x 3 grid of vias, with a 0.6mm diameter annular ring and a 0.3mm drill, equally spaced across the heat slug, would be suitable.

10.3 Moisture Sensitivity

XMOS devices are, like all semiconductor devices, susceptible to moisture absorption. When removed from the sealed packaging, the devices slowly absorb moisture from the surrounding environment. If the level of moisture present in the device is too high during reflow, damage can occur due to the increased internal vapour pressure of moisture. Example damage can include bond wire damage, die lifting, internal or external package cracks and/or delamination.

All XMOS devices are Moisture Sensitivity Level (MSL) 3 - devices have a shelf life of 168 hours between removal from the packaging and reflow, provided they are stored below 30C and 60% RH. If devices have exceeded these values or an included moisture indicator card shows excessive levels of moisture, then the parts should be baked as appropriate before use. This is based on information from *Joint IPC/JEDEC Standard For Moisture/Reflow Sensitivity Classification For Nonhermetic Solid State Surface-Mount Devices* J-STD-020 Revision D.

11 DC and Switching Characteristics

11.1 Operating Conditions

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
VDD	Tile DC supply voltage	0.95	1.00	1.05	V	
VDDIO	I/O supply voltage	3.00	3.30	3.60	V	
PLL_AVDD	PLL analog supply	0.95	1.00	1.05	V	
Cl	xCORE Tile I/O load capacitance			25	pF	
Ta	Ambient operating temperature	0		70	°C	
Ta	Ambient operating temperature	-40		85	°C	
Tj	Junction temperature			125	°C	
Tstg	Storage temperature	-65		150	°C	

Figure 16: Operating conditions

11.2 DC Characteristics

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
V(IH)	Input high voltage	2.00		3.60	V	A
V(IL)	Input low voltage	-0.30		0.70	V	A
V(OH)	Output high voltage	2.00			V	B, C
V(OL)	Output low voltage			0.60	V	B, C
R(PU)	Pull-up resistance		35K		Ω	D
R(PD)	Pull-down resistance		35K		Ω	D

Figure 17: DC characteristics

A All pins except power supply pins.

B Ports 1A, 1D, 1E, 1H, 1I, 1J, 1K and 1L are nominal 8 mA drivers, the remainder of the general-purpose I/Os are 4 mA.

C Measured with 4 mA drivers sourcing 4 mA, 8 mA drivers sourcing 8 mA.

D Used to guarantee logic state for an I/O when high impedance. The internal pull-ups/pull-downs should not be used to pull external circuitry.

11.3 ESD Stress Voltage

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
HBM	Human body model	-2.00		2.00	KV	
MM	Machine model	-200		200	V	

Figure 18: ESD stress voltage

The asynchronous nature of links means that the relative phasing of CLK clocks is not important in a multi-clock system, providing each meets the required stability criteria.

11.9 JTAG Timing

Figure 24: JTAG timing

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
f(TCK_D)	TCK frequency (debug)			18	MHz	
f(TCK_B)	TCK frequency (boundary scan)			10	MHz	
T(SETUP)	TDO to TCK setup time	5			ns	A
T(HOLD)	TDO to TCK hold time	5			ns	A
T(DELAY)	TCK to output delay			15	ns	B

A Timing applies to TMS and TDI inputs.

B Timing applies to TDO output from negative edge of TCK.

All JTAG operations are synchronous to TCK apart from the global asynchronous reset TRST_N.

12 Package Information

	LEAD COUNT		48L
	DIMS.	TOL.	1.0 mm THICK
SEAT HEIGHT	A	MAX.	1.20
STAND OFF	A_1	±0.05	0.10
PACKAGE THICKNESS	A_2	±0.05	1.00
O.D.WIDTH	D	±0.20	9.00
PACKAGE WIDTH	D_1	±0.10	7.00
O.D LENGTH	E	±0.20	9.00
PACKAGE LENGTH	E_1	±0.10	7.00
FOOT LENGTH	L	+0.15/−0.10	0.60
HALF FOOTPRINT	L_1	REF	1.00
LEAD PITCH	e	TYPE	0.50
LEAD WIDTH	b	±0.05	0.22
FOOT ANGLE	θ		0°–7°
VERTICAL ANGLE	θ_1		0° MIN.
	θ_2	±1°	12°
FIRST BEND	R	TYP	0.15
SECOND BEND	R1	±0.05	0.15
	aaa	MAX.	0.08
COPLANARITY	ccc	MAX.	0.08
	JEDEC REFERENCE DRAWING		MS–026
	VARIATION DESIGNATOR		ABC

NOTES:
1. All dimensions in millimeters.
2. Dimension tolerances shall be ±0.05mm unless otherwise specified.
3. Foot length ‘L’ is measured at gage plane 0.25mm above seating plane.
4. Dimension D1 and E1 are bottom package width and length and are measured at datum plane H.
5. Leadframe material: Eftec 64T Cu (or equivalent), 0.127mm (0.005”) thick.

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token 193	24-bit response channel-end identifier	16-bit register number	control-token 1

The response to the read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

A.3 Accessing node configuration

Node configuration registers can be accessed through the interconnect using the functions `write_node_config_reg(device, ...)` and `read_node_config_reg(device, ↪ ...)`, where `device` is the name of the node. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the node configuration registers. The destination of the channel-end should be set to `0xnnnnC30C` where `nnnn` is the node-identifier.

A write message comprises the following:

control-token 192	24-bit response channel-end identifier	16-bit register number	32-bit data	control-token 1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token 193	24-bit response channel-end identifier	16-bit register number	control-token 1

The response to a read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

B.1 RAM base address: 0x00

This register contains the base address of the RAM. It is initialized to 0x00010000.

0x00: RAM base address

Bits	Perm	Init	Description
31:2	RW		Most significant 16 bits of all addresses.
1:0	RO	-	Reserved

B.2 Vector base address: 0x01

Base address of event vectors in each resource. On an interrupt or event, the 16 most significant bits of the destination address are provided by this register; the least significant 16 bits come from the event vector.

0x01: Vector base address

Bits	Perm	Init	Description
31:16	RW		The most significant bits for all event and interrupt vectors.
15:0	RO	-	Reserved

B.3 xCORE Tile control: 0x02

Register to control features in the xCORE tile

0x02: xCORE Tile control

Bits	Perm	Init	Description
31:6	RO	-	Reserved
5	RW	0	Set to 1 to select the dynamic mode for the clock divider when the clock divider is enabled. In dynamic mode the clock divider is only activated when all active logical cores are paused. In static mode the clock divider is always enabled.
4	RW	0	Set to 1 to enable the clock divider. This slows down the xCORE tile clock in order to use less power.
3:0	RO	-	Reserved

B.4 xCORE Tile boot status: 0x03

This read-only register describes the boot status of the xCORE tile.

B.8 Ring Oscillator Value: 0x08

This register contains the current count of the xCORE Tile Wire ring oscillator. This value is not reset on a system reset.

0x08: Ring Oscillator Value

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RO	-	Ring oscillator counter data.

B.9 Ring Oscillator Value: 0x09

This register contains the current count of the Peripheral Cell ring oscillator. This value is not reset on a system reset.

0x09: Ring Oscillator Value

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RO	-	Ring oscillator counter data.

B.10 Ring Oscillator Value: 0x0A

This register contains the current count of the Peripheral Wire ring oscillator. This value is not reset on a system reset.

0x0A: Ring Oscillator Value

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RO	-	Ring oscillator counter data.

B.11 Debug SSR: 0x10

This register contains the value of the SSR register when the debugger was called.

0x10: Debug SSR

Bits	Perm	Init	Description
31:0	RO	-	Reserved

B.12 Debug SPC: 0x11

This register contains the value of the SPC register when the debugger was called.

0x15: Debug interrupt type

Bits	Perm	Init	Description
31:18	RO	-	Reserved
17:16	DRW		If the debug interrupt was caused by a hardware breakpoint or hardware watchpoint, this field contains the number of the breakpoint or watchpoint. If multiple breakpoints or watchpoints trigger at once, the lowest number is taken.
15:8	DRW		If the debug interrupt was caused by a logical core, this field contains the number of that core. Otherwise this field is 0.
7:3	RO	-	Reserved
2:0	DRW	0	Indicates the cause of the debug interrupt 1: Host initiated a debug interrupt through JTAG 2: Program executed a DCALL instruction 3: Instruction breakpoint 4: Data watch point 5: Resource watch point

B.17 Debug interrupt data: 0x16

On a data watchpoint, this register contains the effective address of the memory operation that triggered the debugger. On a resource watchpoint, it countains the resource identifier.

0x16: Debug interrupt data

Bits	Perm	Init	Description
31:0	DRW		Value.

B.18 Debug core control: 0x18

This register enables the debugger to temporarily disable logical cores. When returning from the debug interrupts, the cores set in this register will not execute. This enables single stepping to be implemented.

0x18: Debug core control

Bits	Perm	Init	Description
31:8	RO	-	Reserved
7:0	DRW		1-hot vector defining which logical cores are stopped when not in debug mode. Every bit which is set prevents the respective logical core from running.

0x50 .. 0x53: Data watchpoint address 1

Bits	Perm	Init	Description
31:0	DRW		Value.

B.23 Data watchpoint address 2: 0x60 .. 0x63

This set of registers contains the second address for the four data watchpoints.

0x60 .. 0x63: Data watchpoint address 2

Bits	Perm	Init	Description
31:0	DRW		Value.

B.24 Data breakpoint control register: 0x70 .. 0x73

This set of registers controls each of the four data watchpoints.

0x70 .. 0x73: Data breakpoint control register

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	DRW	0	A bit for each logical core in the tile allowing the breakpoint to be enabled individually for each logical core.
15:3	RO	-	Reserved
2	DRW	0	Set to 1 to enable breakpoints to be triggered on loads. Breakpoints always trigger on stores.
1	DRW	0	By default, data watchpoints trigger if memory in the range [Address1..Address2] is accessed (the range is inclusive of Address1 and Address2). If set to 1, data watchpoints trigger if memory outside the range (Address2..Address1) is accessed (the range is exclusive of Address2 and Address1).
0	DRW	0	When 1 the instruction breakpoint is enabled.

B.25 Resources breakpoint mask: 0x80 .. 0x83

This set of registers contains the mask for the four resource watchpoints.

0x80 .. 0x83: Resources breakpoint mask

Bits	Perm	Init	Description
31:0	DRW		Value.

B.26 Resources breakpoint value: 0x90 .. 0x93

This set of registers contains the value for the four resource watchpoints.

0x90 .. 0x93: Resources breakpoint value

Bits	Perm	Init	Description
31:0	DRW		Value.

B.27 Resources breakpoint control register: 0x9C .. 0x9F

This set of registers controls each of the four resource watchpoints.

0x9C .. 0x9F: Resources breakpoint control register

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	DRW	0	A bit for each logical core in the tile allowing the breakpoint to be enabled individually for each logical core.
15:2	RO	-	Reserved
1	DRW	0	By default, resource watchpoints trigger when the resource id masked with the set Mask equals the Value. If set to 1, resource watchpoints trigger when the resource id masked with the set Mask is not equal to the Value.
0	DRW	0	When 1 the instruction breakpoint is enabled.

C Tile Configuration

The xCORE Tile control registers can be accessed using configuration reads and writes (use `write_tile_config_reg(tileref, ...)` and `read_tile_config_reg(tileref, ↪ ...)` for reads and writes).

Number	Perm	Description
0x00	RO	Device identification
0x01	RO	xCORE Tile description 1
0x02	RO	xCORE Tile description 2
0x04	CRW	Control PSwitch permissions to debug registers
0x05	CRW	Cause debug interrupts
0x06	RW	xCORE Tile clock divider
0x07	RO	Security configuration
0x10 .. 0x13	RO	PLink status
0x20 .. 0x27	CRW	Debug scratch
0x40	RO	PC of logical core 0
0x41	RO	PC of logical core 1
0x42	RO	PC of logical core 2
0x43	RO	PC of logical core 3
0x44	RO	PC of logical core 4
0x45	RO	PC of logical core 5
0x46	RO	PC of logical core 6
0x47	RO	PC of logical core 7
0x60	RO	SR of logical core 0
0x61	RO	SR of logical core 1
0x62	RO	SR of logical core 2
0x63	RO	SR of logical core 3
0x64	RO	SR of logical core 4
0x65	RO	SR of logical core 5
0x66	RO	SR of logical core 6
0x67	RO	SR of logical core 7
0x80 .. 0x9F	RO	Chanend status

Figure 29: Summary

0x0C: Directions 0-7

Bits	Perm	Init	Description
31:28	RW	0	The direction for packets whose first mismatching bit is 7.
27:24	RW	0	The direction for packets whose first mismatching bit is 6.
23:20	RW	0	The direction for packets whose first mismatching bit is 5.
19:16	RW	0	The direction for packets whose first mismatching bit is 4.
15:12	RW	0	The direction for packets whose first mismatching bit is 3.
11:8	RW	0	The direction for packets whose first mismatching bit is 2.
7:4	RW	0	The direction for packets whose first mismatching bit is 1.
3:0	RW	0	The direction for packets whose first mismatching bit is 0.

D.9 Directions 8-15: 0x0D

This register contains eight directions, for packets with a mismatch in bits 15..8 of the node-identifier. The direction in which a packet will be routed is goverened by the most significant mismatching bit.

0x0D: Directions 8-15

Bits	Perm	Init	Description
31:28	RW	0	The direction for packets whose first mismatching bit is 15.
27:24	RW	0	The direction for packets whose first mismatching bit is 14.
23:20	RW	0	The direction for packets whose first mismatching bit is 13.
19:16	RW	0	The direction for packets whose first mismatching bit is 12.
15:12	RW	0	The direction for packets whose first mismatching bit is 11.
11:8	RW	0	The direction for packets whose first mismatching bit is 10.
7:4	RW	0	The direction for packets whose first mismatching bit is 9.
3:0	RW	0	The direction for packets whose first mismatching bit is 8.

D.10 DEBUG_N configuration: 0x10

Configures the behavior of the DEBUG_N pin.

0x10: DEBUG_N configuration

Bits	Perm	Init	Description
31:2	RO	-	Reserved
1	RW	0	Set to 1 to enable signals on DEBUG_N to generate DCALL on the core.
0	RW	0	When set to 1, the DEBUG_N wire will be pulled down when the node enters debug mode.

0x80 .. 0x87: Link configuration and initialization

Bits	Perm	Init	Description
31	RW	0	Write '1' to this bit to enable the link, write '0' to disable it. This bit controls the muxing of ports with overlapping links.
30	RW	0	Set to 0 to operate in 2 wire mode or 1 to operate in 5 wire mode
29:28	RO	-	Reserved
27	RO	0	Set to 1 on error: an RX buffer overflow or illegal token encoding has been received. This bit clears on reading.
26	RO	0	1 if this end of the link has issued credit to allow the remote end to transmit.
25	RO	0	1 if this end of the link has credits to allow it to transmit.
24	WO	0	Set to 1 to initialize a half-duplex link. This clears this end of the link's credit and issues a HELLO token; the other side of the link will reply with credits. This bit is self-clearing.
23	WO	0	Set to 1 to reset the receiver. The next symbol that is detected will be assumed to be the first symbol in a token. This bit is self-clearing.
22	RO	-	Reserved
21:11	RW	0	The number of system clocks between two subsequent transitions within a token
10:0	RW	0	The number of system clocks between two subsequent transmit tokens.

D.15 Static link configuration: 0xA0 .. 0xA7

These registers are used for static (ie, non-routed) links. When a link is made static, all traffic is forwarded to the designated channel end and no routing is attempted. The registers control links C, D, A, B, G, H, E, and F in that order.

0xA0 .. 0xA7: Static link configuration

Bits	Perm	Init	Description
31	RW	0	Enable static forwarding.
30:5	RO	-	Reserved
4:0	RW	0	The destination channel end on this node that packets received in static mode are forwarded to.

E XMOS USB Interface

XMOS provides a low-level USB interface for connecting the device to a USB transceiver using the UTMI+ Low Pin Interface (ULPI). The ULPI signals must be connected to the pins named in Figure 31. Note also that some ports on the same tile are used internally and are not available for use when the USB driver is active (they are available otherwise).

Pin	Signal	Pin	Signal	Pin	Signal
X*n*D12	ULPI_STEP	X*n*D17	ULPI_DATA[3]	X*n*D22	ULPI_DIR
X*n*D13	ULPI_NXT	X*n*D18	ULPI_DATA[4]	X*n*D23	ULPI_CLK
X*n*D14	ULPI_DATA[0]	X*n*D19	ULPI_DATA[5]	X*n*D37	Unavailable
X*n*D15	ULPI_DATA[1]	X*n*D20	ULPI_DATA[6]	X*n*D38	Unavailable
X*n*D16	ULPI_DATA[2]	X*n*D21	ULPI_DATA[7]	X*n*D39	Unavailable

Figure 31: ULPI signals provided by the XMOS USB driver

F Device Errata

This section describes minor operational differences from the data sheet and recommended workarounds. As device and documentation issues become known, this section will be updated the document revised.

To guarantee a logic low is seen on the pins RST_N, MODE[3:0], TRST_N, TMS, TCK and TDI, the driving circuit should present an impedance of less than 100 Ω to ground. Usually this is not a problem for CMOS drivers driving single inputs. If one or more of these inputs are placed in parallel, however, additional logic buffers may be required to guarantee correct operation.

For static inputs tied high or low, the relevant input pin should be tied directly to GND or VDDIO.

G JTAG, xSCOPE and Debugging

If you intend to design a board that can be used with the XMOS toolchain and xTAG debugger, you will need an xSYS header on your board. Figure 32 shows a decision diagram which explains what type of xSYS connectivity you need. The three subsections below explain the options in detail.

G.1 No xSYS header

The use of an xSYS header is optional, and may not be required for volume production designs. However, the XMOS toolchain expects the xSYS header; if you do not have an xSYS header then you must provide your own method for writing to flash/OTP and for debugging.

G.3 Full xSYS header

For a full xSYS header you will need to connect the pins as discussed in Section G.2, and then connect a 2-wire xCONNECT Link to the xSYS header. The links can be found in the Signal description table (Section 4): they are labelled XLA, XLB, etc in the function column. The 2-wire link comprises two inputs and outputs, labelled $^{1}_{out}$, $^{0}_{out}$, $^{0}_{in}$, and $^{1}_{in}$. For example, if you choose to use XLB of tile 0 for xSCOPE I/O, you need to connect up XLB^{1}_{out}, XLB^{0}_{out}, XLB^{0}_{in}, XLB^{1}_{in} as follows:

- XLB^{1}_{out} (X0D16) to pin 6 of the xSYS header with a 33R series resistor close to the device.
- XLB^{0}_{out} (X0D17) to pin 10 of the xSYS header with a 33R series resistor close to the device.
- XLB^{0}_{in} (X0D18) to pin 14 of the xSYS header.
- XLB^{1}_{in} (X0D19) to pin 18 of the xSYS header.

H Schematics Design Check List

☑ This section is a checklist for use by schematics designers using the XS1-L8A-64-TQ48. Each of the following sections contains items to check for each design.

H.1 Power supplies

☐ VDDIO supply is within specification before the VDD (core) supply is turned on. Specifically, the VDDIO supply is within specification before VDD (core) reaches 0.4V (Section 10).

☐ The VDD (core) supply ramps monotonically (rises constantly) from 0V to its final value (0.95V - 1.05V) within 10ms (Section 10).

☐ The VDD (core) supply is capable of supplying 300mA (Section 10).

☐ PLL_AVDD is filtered with a low pass filter, for example an RC filter, see Section 10 .

H.2 Power supply decoupling

☐ The design has multiple decoupling capacitors per supply, for example at least four0402 or 0603 size surface mount capacitors of 100nF in value, per supply (Section 10).

☐ A bulk decoupling capacitor of at least 10uF is placed on each supply (Section 10).

H.3 Power on reset

☐ The RST_N and TRST_N pins are asserted (low) during or after power up. The device is not used until these resets have taken place.
As the errata in the datasheets show, the internal pull-ups on these two pins can occasionally provide stronger than normal pull-up currents. For this reason, an RC type reset circuit is discouraged as behavior would be unpredictable. A voltage supervisor type reset device is recommended to guarantee a good reset. This also has the benefit of resetting the system should the relevant supply go out of specification.

H.4 Clock

☐ The CLK input pin is supplied with a clock with monotonic rising edges and low jitter.
