Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Flash*Freeze Technology

The IGLOO nano device has an ultra-low power static mode, called Flash*Freeze mode, which retains all SRAM and register information and can still quickly return to normal operation. Flash*Freeze technology enables the user to quickly (within 1 µs) enter and exit Flash*Freeze mode by activating the Flash*Freeze pin while all power supplies are kept at their original values. I/Os, global I/Os, and clocks can still be driven and can be toggling without impact on power consumption, and the device retains all core registers, SRAM information, and I/O states. I/Os can be individually configured to either hold their previous state or be tristated during Flash*Freeze mode.

Alternatively, I/Os can be set to a specific state using weak pull-up or pull-down I/O attribute configuration. No power is consumed by the I/O banks, clocks, JTAG pins, or PLL, and the device consumes as little as 2 µW in this mode.

Flash*Freeze technology allows the user to switch to Active mode on demand, thus simplifying the power management of the device.

The Flash*Freeze pin (active low) can be routed internally to the core to allow the user's logic to decide when it is safe to transition to this mode. Refer to Figure 1-5 for an illustration of entering/exiting Flash*Freeze mode. It is also possible to use the Flash*Freeze pin as a regular I/O if Flash*Freeze mode usage is not planned.

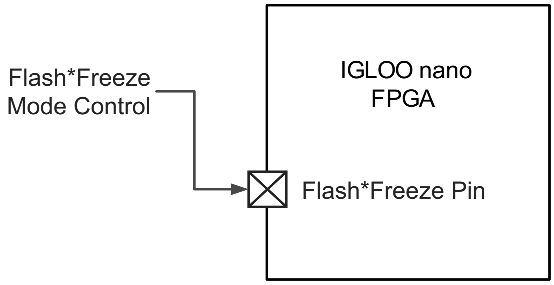

Figure 1-5 • **IGLOO nano Flash*Freeze Mode**

VersaTiles

The IGLOO nano core consists of VersaTiles, which have been enhanced beyond the ProASIC<u>PLUS</u>® core tiles. The IGLOO nano VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to Figure 1-6 for VersaTile configurations.

The length of time an I/O can withstand IOSH/IOSL events depends on the junction temperature. The reliability data below is based on a 3.3 V, 8 mA I/O setting, which is the worst case for this type of analysis.

For example, at 100°C, the short current condition would have to be sustained for more than six months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

Temperature	Time before Failure

3.3 V LVTTL / LVCMOS (Schmitt trigger mode)	240 mV
2.5 V LVCMOS (Schmitt trigger mode)	140 mV
1.8 V LVCMOS (Schmitt trigger mode)	80 mV
1.5 V LVCMOS (Schmitt trigger mode)	60 mV
1.2 V LVCMOS (Schmitt trigger mode)	40 mV

Table 2-33 • **I/O Input Rise Time, Fall Time, and Related I/O Reliability**

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)	Reliability
LVTTL/LVCMOS (Schmitt trigger disabled)	No requirement	10 ns *	20 years (100°C)
LVTTL/LVCMOS (Schmitt trigger enabled)	No requirement	No requirement, but input noise voltage cannot exceed Schmitt hysteresis.	20 years (100°C)

Note: **The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.*

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard–dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-70. Table 2-88 to Table 2-96 on page 2-68 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

Notes:

1. *This delay is a function of voltage and temperature. See Table 2-6 on page 2-6 and Table 2-7 on page 2-7 for deratings.*
2. *T_J = 25°C, V_{CC} = 1.2 V.*
3. *When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the Libero SoC Online Help associated with the core for more information.*
4. *Maximum value obtained for a STD speed grade device in Worst-Case Commercial conditions. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 and Table 2-7 on page 2-7 for derating values.*
5. *Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to the PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by the period jitter parameter.*
6. *VCO output jitter is calculated as a percentage of the VCO frequency. The jitter (in ps) can be calculated by multiplying the VCO period by the % jitter. The VCO jitter (in ps) applies to CCC_OUT, regardless of the output divider settings. For example, if the jitter on VCO is 300 ps, the jitter on CCC_OUT is also 300 ps, no matter what the settings are for the output divider.*
7. *Measurements done with LVTTL 3.3 V 8 mA I/O drive strength and high slew rate. VCC/VCCPLL = 1.14 V, VCCI = 3.3 V, VQ/PQ/TQ type of packages, 20 pF load.*
8. *SSOs are outputs that are synchronous to a single clock domain and have their clock-to-out times within ±200 ps of each other. Switching I/Os are placed outside of the PLL bank. Refer to the "Simultaneously Switching Outputs (SSOs) and Printed Circuit Board Layout" section in the IGLOO nano FPGA Fabric User's Guide.*
9. *The AGLN010, AGLN015, and AGLN020 devices do not support PLLs.*

Notes:

1. *Pin numbers F1 and F2 must be connected to ground because a PLL is not supported for AGLN060Z-CS81.*
2. *The bus hold attribute (hold previous I/O state in Flash*Freeze mode) is not supported for pin H7 in AGLN060Z-CS81.*

Revision	Changes	Page
Revision 11 (Jul 2010)	The status of the AGLN060 device has changed from Advance to Production.	III
	The values for PAC1, PAC2, PAC3, and PAC4 were updated in Table 2-15 • Different Components Contributing to Dynamic Power Consumption in IGLOO nano Devices for 1.5 V core supply voltage (SAR 26404).	2-10
	The values for PAC1, PAC2, PAC3, and PAC4 were updated in Table 2-17 • Different Components Contributing to Dynamic Power Consumption in IGLOO nano Devices for 1.2 V core supply voltage (SAR 26404).	2-11
July 2010	The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "IGLOO nano Device Status" table on page III indicates the status for each device in the device family.	N/A
Revision 10 (Apr 2010)	References to differential inputs were removed from the datasheet, since IGLOO nano devices do not support differential inputs (SAR 21449).	N/A
	A parenthetical note, "hold previous I/O state in Flash*Freeze mode," was added to each occurrence of bus hold in the datasheet (SAR 24079).	N/A
	The "In-System Programming (ISP) and Security" section was revised to add 1.2 V programming.	I
	The note connected with the "IGLOO nano Ordering Information" table was revised to clarify features not available for Z feature grade devices.	IV
	The "IGLOO nano Device Status" table is new.	III
	The definition of C in the "Temperature Grade Offerings" table was changed to "extended commercial temperature range".	VI
	1.2 V wide range was added to the list of voltage ranges in the "I/Os with Advanced I/O Standards" section.	1-8
	A note was added to Table 2-2 • Recommended Operating Conditions [1] regarding switching from 1.2 V to 1.5 V core voltage for in-system programming. The VJTAG voltage was changed from "1.425 to 3.6" to "1.4 to 3.6" (SAR 24052). The note regarding voltage for programming V2 and V5 devices was revised (SAR 25213). The maximum value for VPUMP programming voltage (operation mode) was changed from 3.45 V to 3.6 V (SAR 25220).	2-2
	Table 2-6 • Temperature and Voltage Derating Factors for Timing Delays (normalized to TJ = 70°C, VCC = 1.425 V) and Table 2-7 • Temperature and Voltage Derating Factors for Timing Delays (normalized to TJ = 70°C, VCC = 1.14 V) were updated. Table 2-8 • Power Supply State per Mode is new.	2-6, 2-7
	The tables in the "Quiescent Supply Current" section were updated (SAR 24882 and SAR 24112).	2-7
	VJTAG was removed from Table 2-10 • Quiescent Supply Current (IDD) Characteristics, IGLOO nano Sleep Mode* (SARs 24112, 24882, and 79503).	2-8
	The note stating what was included in I_{DD} was removed from Table 2-11 • Quiescent Supply Current (IDD) Characteristics, IGLOO nano Shutdown Mode. The note, "per VCCI or VJTAG bank" was removed from Table 2-12 • Quiescent Supply Current (IDD), No IGLOO nano Flash*Freeze Mode[1]. The note giving I_{DD} was changed to "$I_{DD} = N_{BANKS} * I_{CCI} + I_{CCA}$."	2-8
	The values in Table 2-13 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings and Table 2-14 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings[1] were updated. Wide range support information was added.	2-9

Revision / Version	Changes	Page
Revision 1 (cont'd) Packaging Advance v0.2	The "QN48" pin diagram was revised.	4-16
	Note 2 for the "QN48", "QN68", and "100-Pin QFN" pin diagrams was changed to "The die attach paddle of the package is tied to ground (GND)."	4-16, 4-19
	The "VQ100" pin diagram was revised to move the pin IDs to the upper left corner instead of the upper right corner.	4-23
Revision 0 (Oct 2008) Product Brief Advance v0.2	The following tables and sections were updated to add the UC81 and CS81 packages for AGL030: "IGLOO nano Devices" "I/Os Per Package" "IGLOO nano Products Available in the Z Feature Grade" "Temperature Grade Offerings"	N/A
	The "I/Os Per Package" table was updated to add the following information to table note 4: "For nano devices, the VQ100 package is offered in both leaded and RoHS-compliant versions. All other packages are RoHS-compliant only."	II
	The "IGLOO nano Products Available in the Z Feature Grade" section was updated to remove QN100 for AGLN250.	VI
	The device architecture figures, Figure 1-3 • IGLOO Device Architecture Overview with Two I/O Banks (AGLN060, AGLN125) through Figure 1-4 • IGLOO Device Architecture Overview with Four I/O Banks (AGLN250), were revised. Figure 1-1 • IGLOO Device Architecture Overview with Two I/O Banks and No RAM (AGLN010 and AGLN030) is new.	1-4 through 1-5
	The "PLL and CCC" section was revised to include information about CCC-GLs in AGLN020 and smaller devices.	1-7
	The "I/Os with Advanced I/O Standards" section was revised to add information about IGLOO nano devices supporting double-data-rate applications.	1-8
