
Welcome to E-XFL.COM

Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

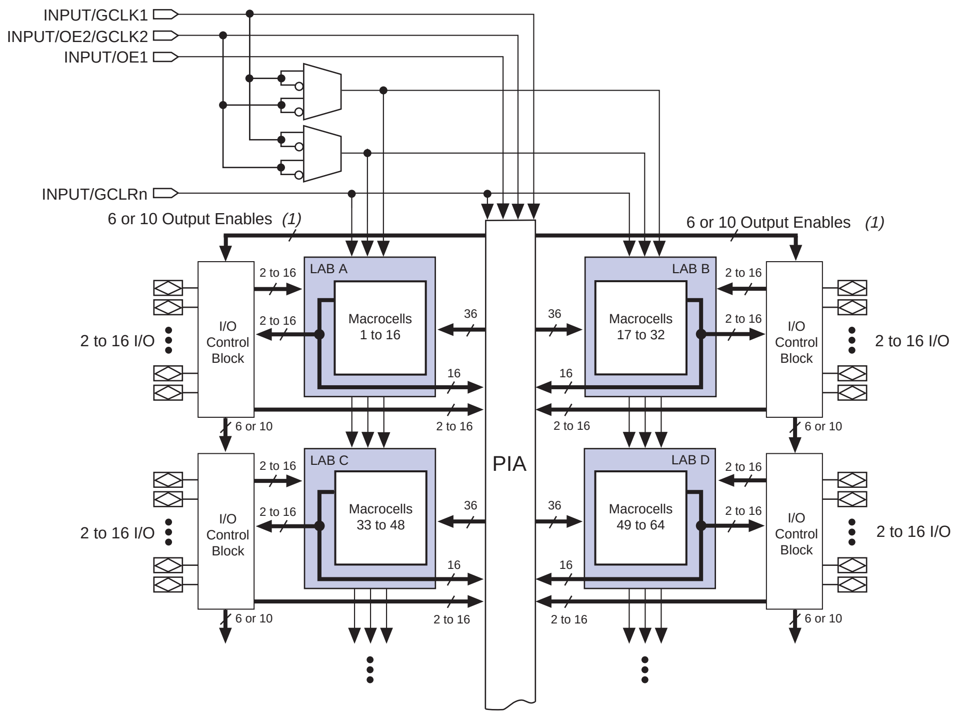
Applications of Embedded - CPLDs

Details	
Product Status	Active
Programmable Type	In System Programmable
Delay Time tpd(1) Max	7.5 ns
Voltage Supply - Internal	2.375V ~ 2.625V
Number of Logic Elements/Blocks	8
Number of Macrocells	128
Number of Gates	2500
Number of I/O	100
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	256-BGA
Supplier Device Package	256-FBGA (17x17)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=epm7128bfc256-7

...and More Features

- System-level features
  - MultiVolt™ I/O interface enabling device core to run at 2.5 V, while I/O pins are compatible with 3.3-V, 2.5-V, and 1.8-V logic levels
  - Programmable power-saving mode for 50% or greater power reduction in each macrocell
  - Fast input setup times provided by a dedicated path from I/O pin to macrocell registers
  - Support for advanced I/O standards, including SSTL-2 and SSTL-3, and GTL+
  - Bus-hold option on I/O pins
  - PCI compatible
  - Bus-friendly architecture including programmable slew-rate control
  - Open-drain output option
  - Programmable security bit for protection of proprietary designs
  - Built-in boundary-scan test circuitry compliant with IEEE Std. 1149.1
  - Supports hot-socketing operation
  - Programmable ground pins
- Advanced architecture features
  - Programmable interconnect array (PIA) continuous routing structure for fast, predictable performance
  - Configurable expander product-term distribution, allowing up to 32 product terms per macrocell
  - Programmable macrocell registers with individual clear, preset, clock, and clock enable controls
  - Two global clock signals with optional inversion
  - Programmable power-up states for macrocell registers
  - 6 to 10 pin- or logic-driven output enable signals
- Advanced package options
  - Pin counts ranging from 44 to 256 in a variety of thin quad flat pack (TQFP), plastic quad flat pack (PQFP), ball-grid array (BGA), space-saving FineLine BGA™, 0.8-mm Ultra FineLine BGA, and plastic J-lead chip carrier (PLCC) packages
  - Pin-compatibility with other MAX 7000B devices in the same package
- Advanced software support
  - Software design support and automatic place-and-route provided by Altera's MAX+PLUS® II development system for Windows-based PCs and Sun SPARCstation, and HP 9000 Series 700/800 workstations

Figure 1. MAX 7000B Device Block Diagram



Note:

(1) EPM7032B, EPM7064B, EPM7128B, and EPM7256B devices have six output enables. EPM7512B devices have ten output enables.

Logic Array Blocks

The MAX 7000B device architecture is based on the linking of high-performance LABs. LABs consist of 16 macrocell arrays, as shown in Figure 1. Multiple LABs are linked together via the PIA, a global bus that is fed by all dedicated input pins, I/O pins, and macrocells.

Each LAB is fed by the following signals:

- 36 signals from the PIA that are used for general logic inputs
- Global controls that are used for secondary register functions
- Direct input paths from I/O pins to the registers that are used for fast setup times

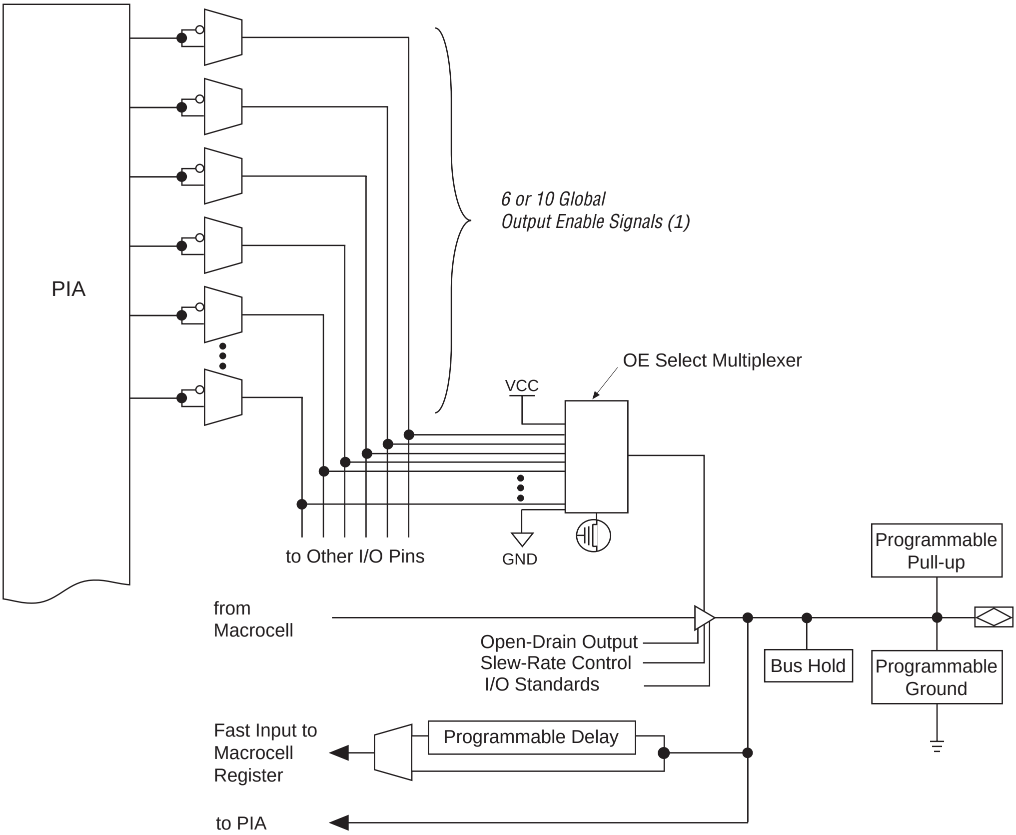
Parallel Expanders

Parallel expanders are unused product terms that can be allocated to a neighboring macrocell to implement fast, complex logic functions. Parallel expanders allow up to 20 product terms to directly feed the macrocell OR logic, with five product terms provided by the macrocell and 15 parallel expanders provided by neighboring macrocells in the LAB.

The Altera Compiler can automatically allocate up to three sets of up to five parallel expanders to the macrocells that require additional product terms. Each set of five parallel expanders incurs a small, incremental timing delay (t_{PEXP}). For example, if a macrocell requires 14 product terms, the Compiler uses the five dedicated product terms within the macrocell and allocates two sets of parallel expanders; the first set includes five product terms and the second set includes four product terms, increasing the total delay by $2 \times t_{PEXP}$.

Two groups of eight macrocells within each LAB (e.g., macrocells 1 through 8, and 9 through 16) form two chains to lend or borrow parallel expanders. A macrocell borrows parallel expanders from lower-numbered macrocells. For example, macrocell 8 can borrow parallel expanders from macrocell 7, from macrocells 7 and 6, or from macrocells 7, 6, and 5. Within each group of eight, the lowest-numbered macrocell can only lend parallel expanders and the highest-numbered macrocell can only borrow them. Figure 4 shows how parallel expanders can be borrowed from a neighboring macrocell.

Figure 6. I/O Control Block of MAX 7000B Devices



Note:

(1) EPM7032B, EPM7064B, EPM7128B, and EPM7256B devices have six output enable signals. EPM7512B devices have ten output enable signals.

When the tri-state buffer control is connected to ground, the output is tri-stated (high impedance) and the I/O pin can be used as a dedicated input. When the tri-state buffer control is connected to V_{CC}, the output is enabled.

The MAX 7000B architecture provides dual I/O feedback, in which macrocell and pin feedbacks are independent. When an I/O pin is configured as an input, the associated macrocell can be used for buried logic.

Programming Sequence

During in-system programming, instructions, addresses, and data are shifted into the MAX 7000B device through the `TDI` input pin. Data is shifted out through the `TDO` output pin and compared against the expected data.

Programming a pattern into the device requires the following six ISP stages. A stand-alone verification of a programmed pattern involves only stages 1, 2, 5, and 6.

1. *Enter ISP*. The enter ISP stage ensures that the I/O pins transition smoothly from user mode to ISP mode. The enter ISP stage requires 1 ms.

2. *Check ID*. Before any program or verify process, the silicon ID is checked. The time required to read this silicon ID is relatively small compared to the overall programming time.

3. *Bulk Erase*. Erasing the device in-system involves shifting in the instructions to erase the device and applying one erase pulse of 100 ms.

4. *Program*. Programming the device in-system involves shifting in the address and data and then applying the programming pulse to program the EEPROM cells. This process is repeated for each EEPROM address.

5. *Verify*. Verifying an Altera device in-system involves shifting in addresses, applying the read pulse to verify the EEPROM cells, and shifting out the data for comparison. This process is repeated for each EEPROM address.

6. *Exit ISP*. An exit ISP stage ensures that the I/O pins transition smoothly from ISP mode to user mode. The exit ISP stage requires 1 ms.

Programming Times

The time required to implement each of the six programming stages can be broken into the following two elements:

- A pulse time to erase, program, or read the EEPROM cells.
- A shifting time based on the test clock (`TCK`) frequency and the number of `TCK` cycles to shift instructions, address, and data into the device.

Programming with External Hardware

MAX 7000B devices can be programmed on Windows-based PCs with an Altera Logic Programmer card, the Master Programming Unit (MPU), and the appropriate device adapter. The MPU performs continuity checking to ensure adequate electrical contact between the adapter and the device.

For more information, see the *Altera Programming Hardware Data Sheet*.

The Altera software can use text- or waveform-format test vectors created with the Altera Text Editor or Waveform Editor to test the programmed device. For added design verification, designers can perform functional testing to compare the functional device behavior with the results of simulation.

Data I/O, BP Microsystems, and other programming hardware manufacturers provide programming support for Altera devices. For more information, see *Programming Hardware Manufacturers*.

IEEE Std. 1149.1 (JTAG) Boundary-Scan Support

MAX 7000B devices include the JTAG boundary-scan test circuitry defined by IEEE Std. 1149.1. Table 6 describes the JTAG instructions supported by MAX 7000B devices. The pin-out tables starting on page 59 of this data sheet show the location of the JTAG control pins for each device. If the JTAG interface is not required, the JTAG pins are available as user I/O pins.

Table 6. MAX 7000B JTAG Instructions

JTAG Instruction	Description
SAMPLE/PRELOAD	Allows a snapshot of signals at the device pins to be captured and examined during normal device operation, and permits an initial data pattern output at the device pins.
EXTEST	Allows the external circuitry and board-level interconnections to be tested by forcing a test pattern at the output pins and capturing test results at the input pins.
BYPASS	Places the 1-bit bypass register between the `TDI` and `TDO` pins, which allows the boundary-scan test data to pass synchronously through a selected device to adjacent devices during normal operation.
CLAMP	Allows the values in the boundary-scan register to determine pin states while placing the 1-bit bypass register between the `TDI` and `TDO` pins.
IDCODE	Selects the IDCODE register and places it between the `TDI` and `TDO` pins, allowing the IDCODE to be serially shifted out of `TDO`.
USERCODE	Selects the 32-bit USERCODE register and places it between the `TDI` and `TDO` pins, allowing the USERCODE value to be shifted out of `TDO`.
ISP Instructions	These instructions are used when programming MAX 7000B devices via the JTAG ports with the MasterBlaster or ByteBlasterMV download cable, or using a Jam File (**.jam**), Jam Byte-Code File (**.jbc**), or Serial Vector Format File (**.svf**) via an embedded processor or test equipment.

Figure 12 shows the typical output drive characteristics of MAX 7000B devices.

Figure 12. Output Drive Characteristics of MAX 7000B Devices

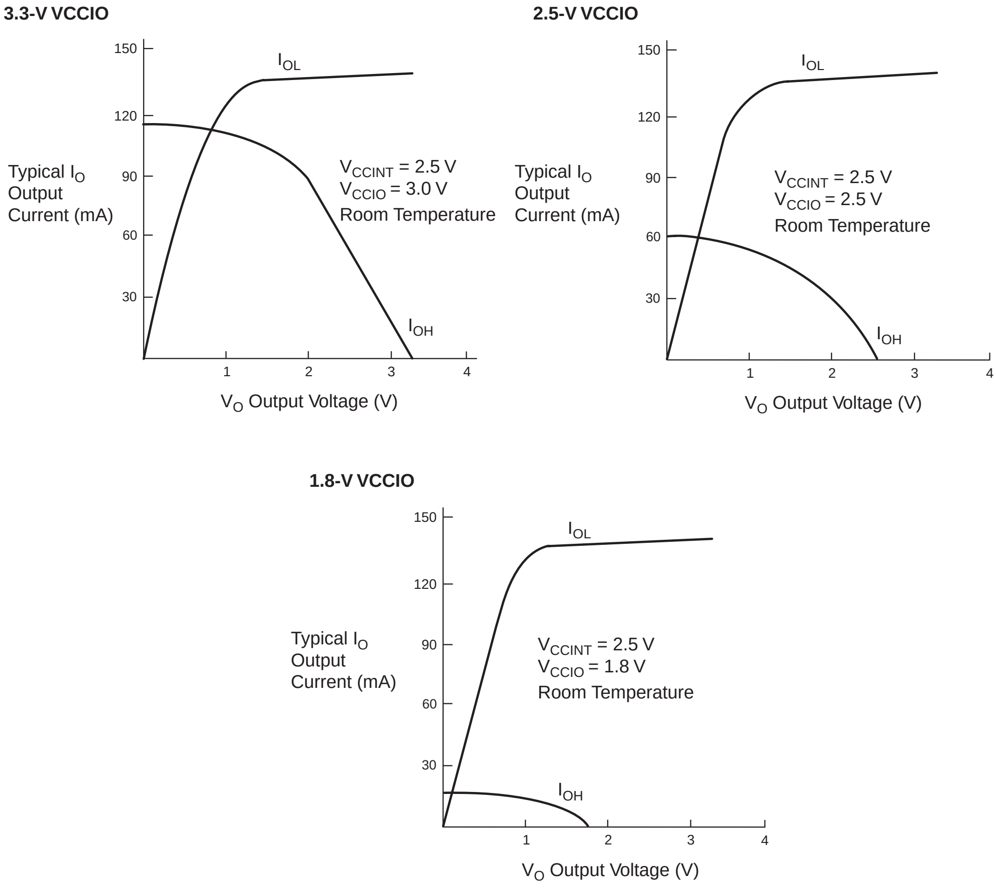


Table 19. EPM7032B Internal Timing Parameters *Notes (1)*

Symbol	Parameter	Conditions	Speed Grade						Unit
			-3.5		-5.0		-7.5		
			Min	Max	Min	Max	Min	Max	
t_{IN}	Input pad and buffer delay			0.3		0.5		0.7	ns
t_{IO}	I/O input pad and buffer delay			0.3		0.5		0.7	ns
t_{FIN}	Fast input delay			0.9		1.3		2.0	ns
t_{FIND}	Programmable delay adder for fast input			1.0		1.5		1.5	ns
t_{SEXP}	Shared expander delay			1.5		2.1		3.2	ns
t_{PEXP}	Parallel expander delay			0.4		0.6		0.9	ns
t_{LAD}	Logic array delay			1.4		2.0		3.1	ns
t_{LAC}	Logic control array delay			1.2		1.7		2.6	ns
t_{IOE}	Internal output enable delay			0.1		0.2		0.3	ns
t_{OD1}	Output buffer and pad delay slow slew rate = off V_{CCIO} = 3.3 V	C1 = 35 pF		0.9		1.2		1.8	ns
t_{OD3}	Output buffer and pad delay slow slew rate = on V_{CCIO} = 2.5 V or 3.3 V	C1 = 35 pF		5.9		6.2		6.8	ns
t_{ZX1}	Output buffer enable delay slow slew rate = off V_{CCIO} = 3.3 V	C1 = 35 pF		1.6		2.2		3.4	ns

Notes to tables:

(1) These values are specified under the Recommended Operating Conditions in Table 15 on page 29. See Figure 14 for more information on switching waveforms.

(2) These values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.1 ns to the PIA timing value.

(3) Measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.

(4) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{ACL}, t_{CPPW}, t_{EN}, and t_{SEXP} parameters for macrocells running in low-power mode.

Table 30. EPM7512B External Timing Parameters *Note (1)*

Symbol	Parameter	Conditions	Speed Grade						Unit
			-5		-7		-10		
			Min	Max	Min	Max	Min	Max	
t_{PD1}	Input to non-registered output	C1 = 35 pF *(2)*		5.5		7.5		10.0	ns
t_{PD2}	I/O input to non-registered output	C1 = 35 pF *(2)*		5.5		7.5		10.0	ns
t_{SU}	Global clock setup time	*(2)*	3.6		4.9		6.5		ns
t_{H}	Global clock hold time	*(2)*	0.0		0.0		0.0		ns
t_{FSU}	Global clock setup time of fast input		1.0		1.5		1.5		ns
t_{FH}	Global clock hold time of fast input		1.0		1.0		1.0		ns
t_{FZHSU}	Global clock setup time of fast input with zero hold time		2.5		3.0		3.0		ns
t_{FZHH}	Global clock hold time of fast input with zero hold time		0.0		0.0		0.0		ns
t_{CO1}	Global clock to output delay	C1 = 35 pF	1.0	3.7	1.0	5.0	1.0	6.7	ns
t_{CH}	Global clock high time		3.0		3.0		4.0		ns
t_{CL}	Global clock low time		3.0		3.0		4.0		ns
t_{ASU}	Array clock setup time	*(2)*	1.4		1.9		2.5		ns
t_{AH}	Array clock hold time	*(2)*	0.5		0.6		0.8		ns
t_{ACO1}	Array clock to output delay	C1 = 35 pF *(2)*	1.0	5.9	1.0	8.0	1.0	10.7	ns
t_{ACH}	Array clock high time		3.0		3.0		4.0		ns
t_{ACL}	Array clock low time		3.0		3.0		4.0		ns
t_{CPPW}	Minimum pulse width for clear and preset		3.0		3.0		4.0		ns
t_{CNT}	Minimum global clock period	*(2)*		6.1		8.4		11.1	ns
f_{CNT}	Maximum internal global clock frequency	*(2)*, *(3)*	163.9		119.0		90.1		MHz
t_{ACNT}	Minimum array clock period	*(2)*		6.1		8.4		11.1	ns
f_{ACNT}	Maximum internal array clock frequency	*(2)*, *(3)*	163.9		119.0		90.1		MHz

Table 32. EPM7512B Selectable I/O Standard Timing Adder Delays (Part 1 of 2) Note (1)

I/O Standard	Parameter	Speed Grade						Unit
		-5		-7		-10		
		Min	Max	Min	Max	Min	Max	
3.3 V TTL/CMOS	Input to PIA		0.0		0.0		0.0	ns
	Input to global clock and clear		0.0		0.0		0.0	ns
	Input to fast input register		0.0		0.0		0.0	ns
	All outputs		0.0		0.0		0.0	ns
2.5 V TTL/CMOS	Input to PIA		0.4		0.5		0.7	ns
	Input to global clock and clear		0.3		0.4		0.5	ns
	Input to fast input register		0.2		0.3		0.3	ns
	All outputs		0.2		0.3		0.3	ns
1.8 V TTL/CMOS	Input to PIA		0.7		1.0		1.3	ns
	Input to global clock and clear		0.6		0.8		1.0	ns
	Input to fast input register		0.5		0.6		0.8	ns
	All outputs		1.3		1.8		2.3	ns
SSTL-2 Class I	Input to PIA		1.5		2.0		2.7	ns
	Input to global clock and clear		1.4		1.9		2.5	ns
	Input to fast input register		1.1		1.5		2.0	ns
	All outputs		0.0		0.0		0.0	ns
SSTL-2 Class II	Input to PIA		1.5		2.0		2.7	ns
	Input to global clock and clear		1.4		1.9		2.5	ns
	Input to fast input register		1.1		1.5		2.0	ns
	All outputs		–0.1		–0.1		–0.2	ns
SSTL-3 Class I	Input to PIA		1.4		1.9		2.5	ns
	Input to global clock and clear		1.2		1.6		2.2	ns
	Input to fast input register		1.0		1.4		1.8	ns
	All outputs		0.0		0.0		0.0	ns
SSTL-3 Class II	Input to PIA		1.4		1.9		2.5	ns
	Input to global clock and clear		1.2		1.6		2.2	ns
	Input to fast input register		1.0		1.4		1.8	ns
	All outputs		0.0		0.0		0.0	ns
GTL+	Input to PIA		1.8		2.5		3.3	ns
	Input to global clock and clear		1.9		2.6		3.5	ns
	Input to fast input register		1.8		2.5		3.3	ns
	All outputs		0.0		0.0		0.0	ns

Table 32. EPM7512B Selectable I/O Standard Timing Adder Delays (Part 2 of 2) Note (1)

I/O Standard	Parameter	Speed Grade						Unit
		-5		-7		-10		
		Min	Max	Min	Max	Min	Max	
PCI	Input to PIA		0.0		0.0		0.0	ns
	Input to global clock and clear		0.0		0.0		0.0	ns
	Input to fast input register		0.0		0.0		0.0	ns
	All outputs		0.0		0.0		0.0	ns

Notes to tables:

(1) These values are specified under the Recommended Operating Conditions in Table 15 on page 29. See Figure 14 for more information on switching waveforms.

(2) These values are specified for a PIA fan-out of one LAB (16 macrocells). For each additional LAB fan-out in these devices, add an additional 0.12 ns to the PIA timing value.

(3) Measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.

(4) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{ACL}, t_{CPPW}, t_{EN}, and t_{SEXP} parameters for macrocells running in low-power mode.

Power Consumption

Supply power (P) versus frequency ($\mathbf{f_{MAX}}$, in MHz) for MAX 7000B devices is calculated with the following equation:

$$P = P_{INT} + P_{IO} = I_{CCINT} \times V_{CC} + P_{IO}$$

The P_{IO} value, which depends on the device output load characteristics and switching frequency, can be calculated using the guidelines given in *Application Note 74 (Evaluating Power for Altera Devices)*.
