Understanding Embedded - CPLDs (Complex Programmable Logic Devices)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	10 ns
Voltage Supply - Internal	2.375V ~ 2.625V
Number of Logic Elements/Blocks	16
Number of Macrocells	256
Number of Gates	5000
Number of I/O	164
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	256-BGA
Supplier Device Package	256-FBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/intel/epm7256bfc256-10

...and More Features

- System-level features
  - MultiVolt™ I/O interface enabling device core to run at 2.5 V, while I/O pins are compatible with 3.3-V, 2.5-V, and 1.8-V logic levels
  - Programmable power-saving mode for 50% or greater power reduction in each macrocell
  - Fast input setup times provided by a dedicated path from I/O pin to macrocell registers
  - Support for advanced I/O standards, including SSTL-2 and SSTL-3, and GTL+
  - Bus-hold option on I/O pins
  - PCI compatible
  - Bus-friendly architecture including programmable slew-rate control
  - Open-drain output option
  - Programmable security bit for protection of proprietary designs
  - Built-in boundary-scan test circuitry compliant with IEEE Std. 1149.1
  - Supports hot-socketing operation
  - Programmable ground pins
- Advanced architecture features
  - Programmable interconnect array (PIA) continuous routing structure for fast, predictable performance
  - Configurable expander product-term distribution, allowing up to 32 product terms per macrocell
  - Programmable macrocell registers with individual clear, preset, clock, and clock enable controls
  - Two global clock signals with optional inversion
  - Programmable power-up states for macrocell registers
  - 6 to 10 pin- or logic-driven output enable signals
- Advanced package options
  - Pin counts ranging from 44 to 256 in a variety of thin quad flat pack (TQFP), plastic quad flat pack (PQFP), ball-grid array (BGA), space-saving FineLine BGA™, 0.8-mm Ultra FineLine BGA, and plastic J-lead chip carrier (PLCC) packages
  - Pin-compatibility with other MAX 7000B devices in the same package
- Advanced software support
  - Software design support and automatic place-and-route provided by Altera's MAX+PLUS® II development system for Windows-based PCs and Sun SPARCstation, and HP 9000 Series 700/800 workstations

– Additional design entry and simulation support provided by EDIF 2 0 0 and 3 0 0 netlist files, library of parameterized modules (LPMs), Verilog HDL, VHDL, and other interfaces to popular EDA tools from manufacturers such as Cadence, Exemplar Logic, Mentor Graphics, OrCAD, Synopsys, Synplicity, and VeriBest
– Programming support with Altera's Master Programming Unit (MPU), MasterBlaster™ serial/universal serial bus (USB) communications cable, and ByteBlasterMV™ parallel port download cable, as well as programming hardware from third-party manufacturers and any Jam™ STAPL File (**.jam**), Jam Byte-Code File (**.jbc**), or Serial Vector Format File (**.svf**)-capable in-circuit tester

General Description

MAX 7000B devices are high-density, high-performance devices based on Altera's second-generation MAX architecture. Fabricated with advanced CMOS technology, the EEPROM-based MAX 7000B devices operate with a 2.5-V supply voltage and provide 600 to 10,000 usable gates, ISP, pin-to-pin delays as fast as 3.5 ns, and counter speeds up to 303.0 MHz. See Table 2.

Table 2. MAX 7000B Speed Grades *Note (1)*

Device	Speed Grade				
	-3	-4	-5	-7	-10
EPM7032B	✓		✓	✓	
EPM7064B	✓		✓	✓	
EPM7128B		✓		✓	✓
EPM7256B			✓	✓	✓
EPM7512B			✓	✓	✓

Notes:
(1) Contact Altera Marketing for up-to-date information on available device speed grades.

The MAX 7000B architecture supports 100% TTL emulation and high-density integration of SSI, MSI, and LSI logic functions. It easily integrates multiple devices ranging from PALs, GALs, and 22V10s to MACH and pLSI devices. MAX 7000B devices are available in a wide range of packages, including PLCC, BGA, FineLine BGA, 0.8-mm Ultra FineLine BGA, PQFP, TQFP, and TQFP packages. See Table 3.

Table 3. MAX 7000B Maximum User I/O Pins *Note (1)*

Device	44-Pin PLCC	44-Pin TQFP	48-Pin TQFP *(2)*	49-Pin 0.8-mm Ultra FineLine BGA *(3)*	100-Pin TQFP	100-Pin FineLine BGA *(4)*	144-Pin TQFP	169-Pin 0.8-mm Ultra FineLine BGA *(3)*	208-Pin PQFP	256-Pin BGA	256-Pin FineLine BGA *(4)*
EPM7032B	36	36	36	36							
EPM7064B	36	36	40	41	68	68					
EPM7128B				41	84	84	100	100			100
EPM7256B					84		120	141	164		164
EPM7512B							120	141	176	212	212

Notes:

(1) When the IEEE Std. 1149.1 (JTAG) interface is used for in-system programming or boundary-scan testing, four I/O pins become JTAG pins.

(2) Contact Altera for up-to-date information on available device package options.

(3) All 0.8-mm Ultra FineLine BGA packages are footprint-compatible via the SameFrame™ pin-out feature. Therefore, designers can design a board to support a variety of devices, providing a flexible migration path across densities and pin counts. Device migration is fully supported by Altera development tools. See “SameFrame Pin-Outs” on page 14 for more details.

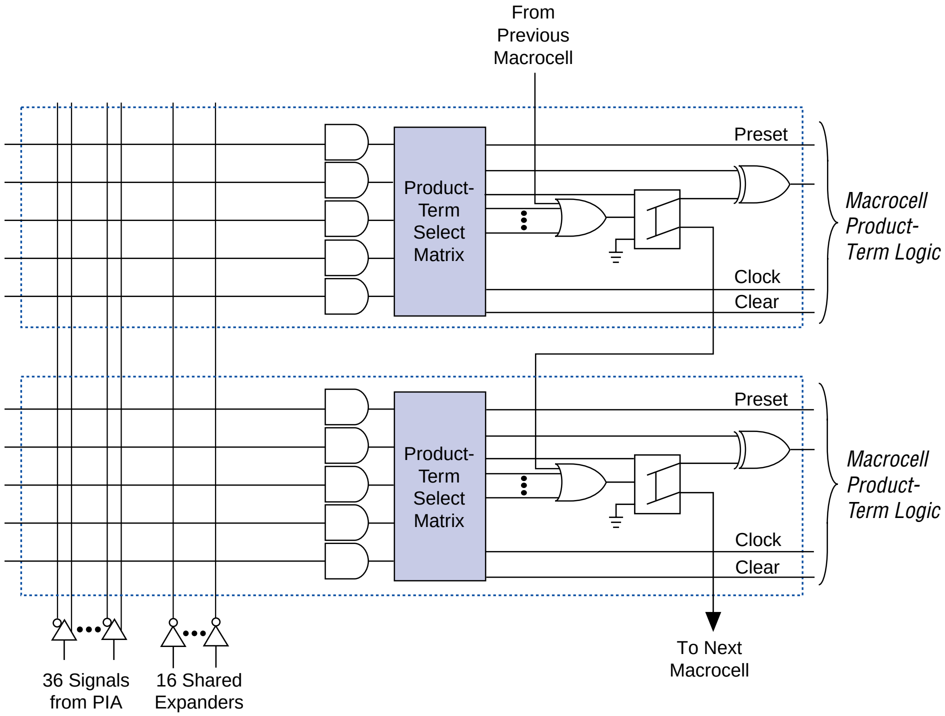
(4) All FineLine BGA packages are footprint-compatible via the SameFrame pin-out feature. Therefore, designers can design a board to support a variety of devices, providing a flexible migration path across densities and pin counts. Device migration is fully supported by Altera development tools. See “SameFrame Pin-Outs” on page 14 for more details.

MAX 7000B devices use CMOS EEPROM cells to implement logic functions. The user-configurable MAX 7000B architecture accommodates a variety of independent combinatorial and sequential logic functions. The devices can be reprogrammed for quick and efficient iterations during design development and debug cycles, and can be programmed and erased up to 100 times.

MAX 7000B devices contain 32 to 512 macrocells that are combined into groups of 16 macrocells, called logic array blocks (LABs). Each macrocell has a programmable-AND/fixed-OR array and a configurable register with independently programmable clock, clock enable, clear, and preset functions. To build complex logic functions, each macrocell can be supplemented with both shareable expander product terms and high-speed parallel expander product terms to provide up to 32 product terms per macrocell.

Figure 4. MAX 7000B Parallel Expanders

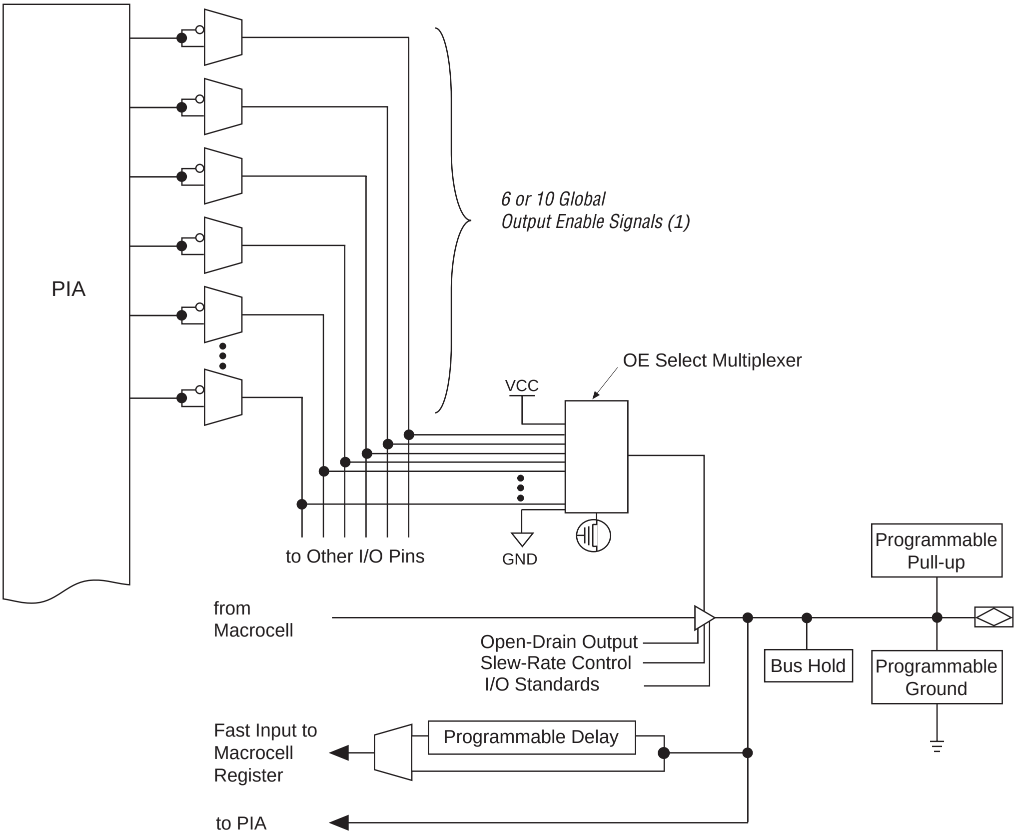
Unused product terms in a macrocell can be allocated to a neighboring macrocell.



Programmable Interconnect Array

Logic is routed between LABs on the PIA. This global bus is a programmable path that connects any signal source to any destination on the device. All MAX 7000B dedicated inputs, I/O pins, and macrocell outputs feed the PIA, which makes the signals available throughout the entire device. Only the signals required by each LAB are actually routed from the PIA into the LAB. Figure 5 shows how the PIA signals are routed into the LAB. An EEPROM cell controls one input to a two-input AND gate, which selects a PIA signal to drive into the LAB.

Figure 6. I/O Control Block of MAX 7000B Devices



Note:

(1) EPM7032B, EPM7064B, EPM7128B, and EPM7256B devices have six output enable signals. EPM7512B devices have ten output enable signals.

When the tri-state buffer control is connected to ground, the output is tri-stated (high impedance) and the I/O pin can be used as a dedicated input. When the tri-state buffer control is connected to V_{CC}, the output is enabled.

The MAX 7000B architecture provides dual I/O feedback, in which macrocell and pin feedbacks are independent. When an I/O pin is configured as an input, the associated macrocell can be used for buried logic.

Programmable Speed/Power Control

MAX 7000B devices offer a power-saving mode that supports low-power operation across user-defined signal paths or the entire device. This feature allows total power dissipation to be reduced by 50% or more, because most logic applications require only a small fraction of all gates to operate at maximum frequency.

The designer can program each individual macrocell in a MAX 7000B device for either high-speed or low-power operation. As a result, speed-critical paths in the design can run at high speed, while the remaining paths can operate at reduced power. Macrocells that run at low power incur a nominal timing delay adder (t_{LPA}) for the t_{LAD}, t_{LAC}, t_{IC}, t_{ACL}, t_{CPPW}, t_{EN}, and t_{SEXP} parameters.

Output Configuration

MAX 7000B device outputs can be programmed to meet a variety of system-level requirements.

MultiVolt I/O Interface

The MAX 7000B device architecture supports the MultiVolt I/O interface feature, which allows MAX 7000B devices to connect to systems with differing supply voltages. MAX 7000B devices in all packages can be set for 3.3-V, 2.5-V, or 1.8-V pin operation. These devices have one set of V_{CC} pins for internal operation and input buffers (`VCCINT`), and another set for I/O output drivers (`VCCIO`).

The `VCCIO` pins can be connected to either a 3.3-V, 2.5-V, or 1.8-V power supply, depending on the output requirements. When the `VCCIO` pins are connected to a 1.8-V power supply, the output levels are compatible with 1.8-V systems. When the `VCCIO` pins are connected to a 2.5-V power supply, the output levels are compatible with 2.5-V systems. When the `VCCIO` pins are connected to a 3.3-V power supply, the output high is at 3.3 V and is therefore compatible with 3.3-V or 5.0-V systems. Devices operating with V_{CCIO} levels of 2.5 V or 1.8 V incur a nominal timing delay adder.

Table 10 describes the MAX 7000B MultiVolt I/O support.

Power Sequencing & Hot-Socketing

Because MAX 7000B devices can be used in a mixed-voltage environment, they have been designed specifically to tolerate any possible power-up sequence. The V_{CCIO} and V_{CCINT} power planes can be powered in any order.

Signals can be driven into MAX 7000B devices before and during power-up (and power-down) without damaging the device. Additionally, MAX 7000B devices do not drive out during power-up. Once operating conditions are reached, MAX 7000B devices operate as specified by the user.

MAX 7000B device I/O pins will not source or sink more than 300 µA of DC current during power-up. All pins can be driven up to 4.1 V during hot-socketing.

Design Security

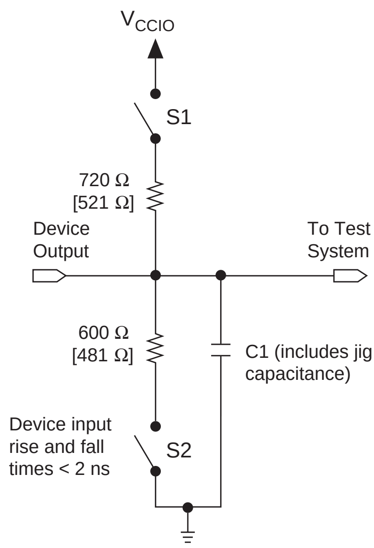
All MAX 7000B devices contain a programmable security bit that controls access to the data programmed into the device. When this bit is programmed, a design implemented in the device cannot be copied or retrieved. This feature provides a high level of design security, because programmed data within EEPROM cells is invisible. The security bit that controls this function, as well as all other programmed data, is reset only when the device is reprogrammed.

Generic Testing

MAX 7000B devices are fully functionally tested. Complete testing of each programmable EEPROM bit and all internal logic elements ensures 100% programming yield. AC test measurements are taken under conditions equivalent to those shown in Figure 11. Test patterns can be used and then erased during early stages of the production flow.

Figure 11. MAX 7000B AC Test Conditions

Power supply transients can affect AC measurements. Simultaneous transitions of multiple outputs should be avoided for accurate measurement. Threshold tests must not be performed under AC conditions. Large-amplitude, fast-ground-current transients normally occur as the device outputs discharge the load capacitances. When these transients flow through the parasitic inductance between the device ground pin and the test system ground, significant reductions in observable noise immunity can result. Numbers in brackets are for 2.5-V outputs. Numbers without brackets are for 3.3-V outputs. Switches S1 and S2 are open for all tests except output disable timing parameters.



Operating Conditions

Tables 14 through 17 provide information on absolute maximum ratings, recommended operating conditions, operating conditions, and capacitance for MAX 7000B devices.

Table 14. MAX 7000B Device Absolute Maximum Ratings *Note (1)*

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CCINT}	Supply voltage		–0.5	3.6	V
V_{CCIO}	Supply voltage		–0.5	3.6	V
V_I	DC input voltage	*(2)*	–2.0	4.6	V
I_{OUT}	DC output current, per pin		–33	50	mA
T_{STG}	Storage temperature	No bias	–65	150	° C
T_A	Ambient temperature	Under bias	–65	135	° C
T_J	Junction temperature	Under bias	–65	135	° C

Figure 12 shows the typical output drive characteristics of MAX 7000B devices.

Figure 12. Output Drive Characteristics of MAX 7000B Devices

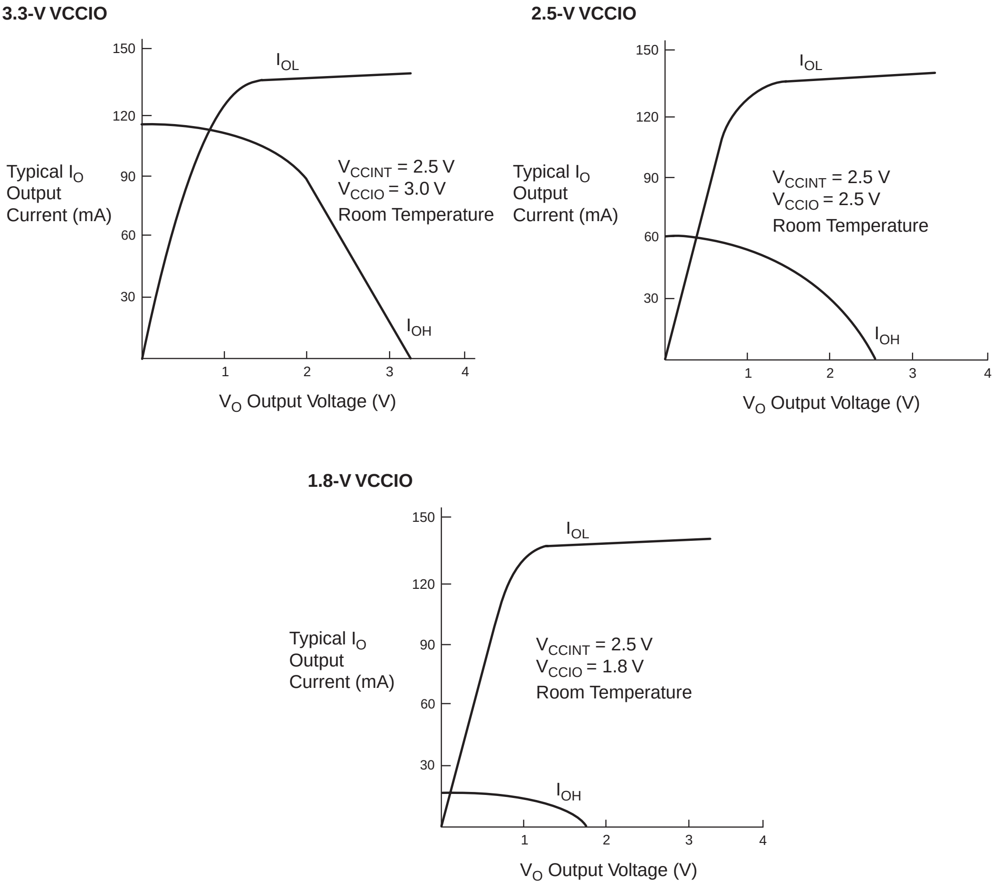


Figure 14. MAX 7000B Switching Waveforms

t_R & t_F < 2 ns. Inputs are driven at 3.0 V for a logic high and 0 V for a logic low. All timing characteristics are measured at 1.5 V.

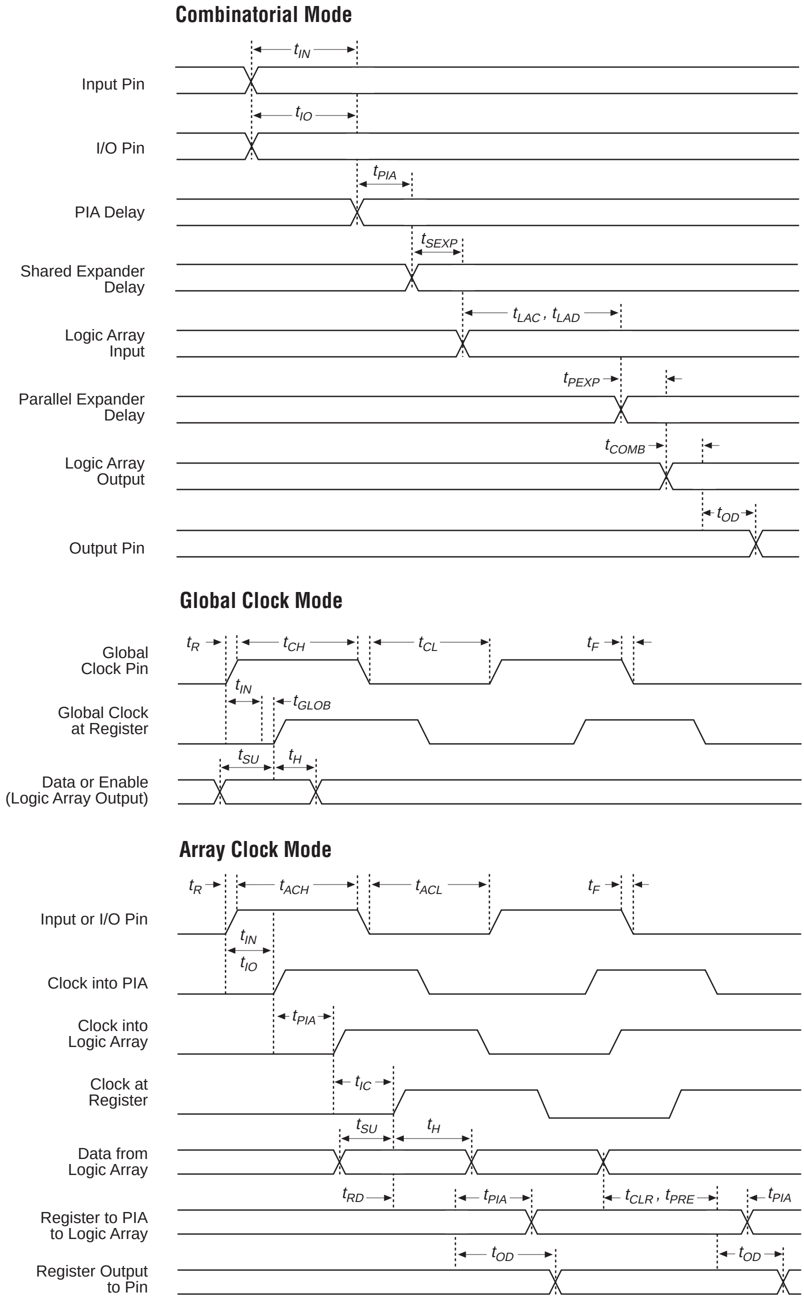

Table 19. EPM7032B Internal Timing Parameters *Notes (1)*									
Symbol	Parameter	Conditions	Speed Grade						Unit
			-3.5		-5.0		-7.5		
			Min	Max	Min	Max	Min	Max

Table 20. EPM7032B Selectable I/O Standard Timing Adder Delays *Notes (1)*								
I/O Standard	Parameter	Speed Grade						Unit
		-3.5		-5.0		-7.5		
		Min	Max	Min	Max	Min	Max	
PCI	Input to PIA		0.0		0.0		0.0	ns
	Input to global clock and clear		0.0		0.0		0.0	ns
	Input to fast input register		0.0		0.0		0.0	ns
	All outputs		0.0		0.0		0.0	ns

Notes to tables:

(1) These values are specified under the Recommended Operating Conditions in Table 15 on page 29. See Figure 14 for more information on switching waveforms.

(2) These values are specified for a PIA fan-out of all LABs.

(3) Measured with a 16-bit loadable, enabled, up/down counter programmed into each LAB.

(4) The t_{LPA} parameter must be added to the t_{LAD}, t_{LAC}, t_{IC}, t_{ACL}, t_{CPPW}, t_{EN}, and t_{SEXP} parameters for macrocells running in low-power mode.

	Input to global clock and clear		0.3		0.4		0.5	ns
	Input to fast input register		0.2		0.3		0.3	ns
	All outputs		0.2		0.3		0.3	ns
1.8 V TTL/CMOS	Input to PIA		0.7		1.0		1.3	ns
	Input to global clock and clear		0.6		0.8		1.0	ns
	Input to fast input register		0.5		0.6		0.8	ns
	All outputs		1.3		1.8		2.3	ns
SSTL-2 Class I	Input to PIA		1.5		2.0		2.7	ns
	Input to global clock and clear		1.4		1.9		2.5	ns
	Input to fast input register		1.1		1.5		2.0	ns
	All outputs		0.0		0.0		0.0	ns
SSTL-2 Class II	Input to PIA		1.5		2.0		2.7	ns
	Input to global clock and clear		1.4		1.9		2.5	ns
	Input to fast input register		1.1		1.5		2.0	ns
	All outputs		–0.1		–0.1		–0.2	ns
SSTL-3 Class I	Input to PIA		1.4		1.9		2.5	ns
	Input to global clock and clear		1.2		1.6		2.2	ns
	Input to fast input register		1.0		1.4		1.8	ns
	All outputs		0.0		0.0		0.0	ns
SSTL-3 Class II	Input to PIA		1.4		1.9		2.5	ns
	Input to global clock and clear		1.2		1.6		2.2	ns
	Input to fast input register		1.0		1.4		1.8	ns
	All outputs		0.0		0.0		0.0	ns
GTL+	Input to PIA		1.8		2.5		3.3	ns
	Input to global clock and clear		1.9		2.6		3.5	ns
	Input to fast input register		1.8		2.5		3.3	ns
	All outputs		0.0		0.0		0.0	ns
