
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	I²C, IrDA, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	31
Program Memory Size	16KB (16K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LCC (J-Lead)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f1601vn020sc

List of Tables

Braces

The curly braces, { }, indicate a single register or bus created by concatenating some combination of smaller registers, buses, or individual bits.

- Example: the 12-bit register address {0H, RP[7:4], R1[3:0]} is composed of a 4-bit hexadecimal value (0H) and two 4-bit register values taken from the Register Pointer (RP) and Working Register R1. 0H is the most significant nibble (4-bit value) of the 12-bit register, and R1[3:0] is the least significant nibble of the 12-bit register.

Parentheses

The parentheses, ( ), indicate an indirect register address lookup.

- Example: (R1) is the memory location referenced by the address contained in the Working Register R1.

Parentheses/Bracket Combinations

The parentheses, ( ), indicate an indirect register address lookup and the square brackets, [ ], indicate a register or bus.

- *Example:* assume PC[15:0] contains the value 1234h. (PC[15:0]) then refers to the contents of the memory location at address 1234h.

Use of the Words *Set*, *Reset* and *Clear*

The word *set* implies that a register bit or a condition contains a logical 1. The words re*set* or *clear* imply that a register bit or a condition contains a logical 0. When either of these terms is followed by a number, the word *logical* may not be included; however, it is implied.

Notation for Bits and Similar Registers

A field of bits within a register is designated as: Register[*n*:*n*].

- Example: ADDR[15:0] refers to bits 15 through bit 0 of the Address.

Use of the Terms *LSB*, *MSB*, *lsb*, and *msb*

In this document, the terms *LSB* and *MSB*, when appearing in upper case, mean *least significant byte* and *most significant byte*, respectively. The lowercase forms, *lsb* and *msb*, mean *least significant bit* and *most significant bit*, respectively.

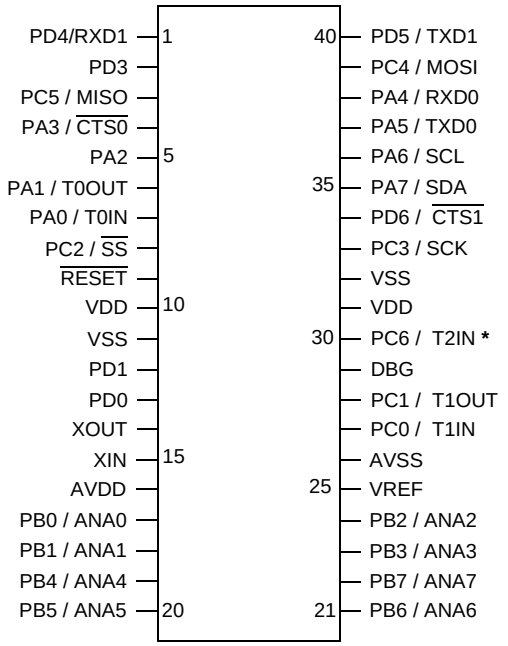
Use of Initial Uppercase Letters

Initial uppercase letters designate settings, modes, and conditions in general text.

- Example 1: Stop mode.
- Example 2: The receiver forces the SCL line to Low.
- The Master can generate a Stop condition to abort the transfer.

Pin Configurations

Figures 56 through 61 illustrate the pin configurations for all of the packages available in the Z8 Encore!® MCU family. Refer to Table 2 for a description of the signals.



Note: Timer 3 is not supported.

***** T2OUT is not supported.

Figure 56. Z8Fxx01 in 40-Pin Dual Inline Package (DIP)

Reset and Stop Mode Recovery

Overview

The Reset Controller within the Z8F640x family devices controls Reset and STOP Mode Recovery operation. In typical operation, the following events cause a Reset to occur:

- Power-On Reset (POR)
- Voltage Brown-Out (VBO)
- Watch-Dog Timer time-out (when configured via the WDT_RES Option Bit to initiate a reset)
- External $\overline{\text{RESET}}$ pin assertion
- On-Chip Debugger initiated Reset (OCDCTL[1] set to 1)

When the Z8F640x family device is in Stop mode, a Stop Mode Recovery is initiated by either of the following:

- Watch-Dog Timer time-out
- GPIO Port input pin transition on an enabled Stop Mode Recovery source
- DBG pin driven Low

Reset Types

The Z8F640x family provides several different types of Reset operation. Stop Mode Recovery is considered a form of Reset. The type of Reset is a function of both the current operating mode of the Z8F640x family device and the source of the Reset. Table 7 lists the types of Reset and their operating characteristics. The System Reset is longer than the Short Reset to allow additional time for external oscillator start-up.

Table 7. Reset and Stop Mode Recovery Characteristics and Latency

	Reset Characteristics and Latency		
Reset Type	**Control Registers**	**eZ8 CPU**	**Reset Latency (Delay)**
System Reset	Reset (as applicable)	Reset	514 WDT Oscillator cycles + 16 System Clock cycles
Short Reset	Reset (as applicable)	Reset	66 WDT Oscillator cycles + 16 System Clock cycles
Stop Mode Recovery	Unaffected, except WDT_CTL register	Reset	514 WDT Oscillator cycles + 16 System Clock cycles

Interrupt Request 2 Register

The Interrupt Request 2 (IRQ2) register (Table 25) stores interrupt requests for both vectored and polled interrupts. When a request is presented to the interrupt controller, the corresponding bit in the IRQ2 register becomes 1. If interrupts are globally enabled (vectored interrupts), the interrupt controller passes an interrupt request to the eZ8 CPU. If interrupts are globally disabled (polled interrupts), the eZ8 CPU can read the Interrupt Request 1 register to determine if any interrupt requests are pending.

Table 25. Interrupt Request 2 Register (IRQ2)

BITS	7	6	5	4	3	2	1	0
FIELD	T3I	U1RXI	U1TXI	DMAI	PC3I	PC2I	PC1I	PC0I
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	FC6H							

T3I—Timer 3 Interrupt Request
0 = No interrupt request is pending for Timer 3.
1 = An interrupt request from Timer 3 is awaiting service.

U1RXI—UART 1 Receive Interrupt Request
0 = No interrupt request is pending for the UART1 receiver.
1 = An interrupt request from UART1 receiver is awaiting service.

U1TXI—UART 1 Transmit Interrupt Request
0 = No interrupt request is pending for the UART 1 transmitter.
1 = An interrupt request from the UART 1 transmitter is awaiting service.

DMAI—DMA Interrupt Request
0 = No interrupt request is pending for the DMA.
1 = An interrupt request from the DMA is awaiting service.

PC*x*I—Port C Pin *x* Interrupt Request
0 = No interrupt request is pending for GPIO Port C pin *x*.
1 = An interrupt request from GPIO Port C pin *x* is awaiting service.

where *x* indicates the specific GPIO Port C pin number (0 through 3).

Table 53. UART*x* Status 1 Register (U*x*STAT1)

BITS	7	6	5	4	3	2	1	0
FIELD	Reserved							MPRX
RESET	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R
ADDR	F44H and F4CH							

Reserved
These bits are reserved and must be 0.

MPRX—Multiprocessor Receive
This status bit is for the receiver and reflects the actual status of the last multiprocessor bit received. Reading from the UART Data register resets this bit to 0.

UART*x* Control 0 and Control 1 Registers

The UART*x* Control 0 and Control 1 registers (Tables 54 and 55) configure the properties of the UART's transmit and receive operations. The UART Control registers must ben be written while the UART is enabled.

Table 54. UART*x* Control 0 Register (U*x*CTL0)

BITS	7	6	5	4	3	2	1	0
FIELD	TEN	REN	CTSE	PEN	PSEL	SBRK	STOP	LBEN
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	F42H and F4AH							

TEN—Transmit Enable
This bit enables or disables the transmitter. The enable is also controlled by the $\overline{\text{CTS}}$ signal and the CTSE bit. If the $\overline{\text{CTS}}$ signal is low and the CTSE bit is 1, the transmitter is enabled.
0 = Transmitter disabled.
1 = Transmitter enabled.

REN—Receive Enable
This bit enables or disables the receiver.
0 = Receiver disabled.
1 = Receiver enabled.

Serial Peripheral Interface

Overview

The Serial Peripheral Interface™ (SPI) is a synchronous interface allowing several SPI-type devices to be interconnected. SPI-compatible devices include EEPROMs, Analog-to-Digital Converters, and ISDN devices. Features of the SPI include:

- Full-duplex, synchronous, character-oriented communication
- Four-wire interface
- Data transfers rates up to a maximum of one-fourth the system clock frequency
- Error detection
- Write and mode collision detection
- Dedicated Baud Rate Generator

Architecture

The SPI may be configured as either a Master (in single or multi-master systems) or a Slave as illustrated in Figures 74 through 76.

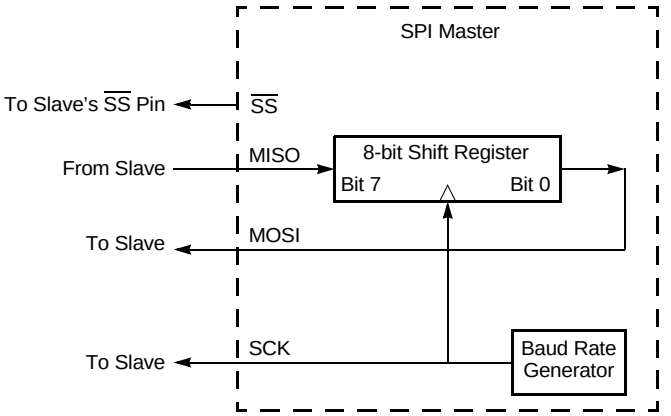


Figure 74. SPI Configured as a Master in a Single Master, Single Slave System

SPI Baud Rate High and Low Byte Registers

The SPI Baud Rate High and Low Byte registers combine to form a 16-bit reload value, BRG[15:0], for the SPI Baud Rate Generator. The reload value must be greater than or equal to 0002H for proper SPI operation (maximum baud rate is system clock frequency divided by 4). The SPI baud rate is calculated using the following equation:

$$\text{SPI Baud Rate (bits/s)} = \frac{\text{System Clock Frequency (Hz)}}{2 \times \text{BRG[15:0]}}$$

Table 64. SPI Baud Rate High Byte Register (SPIBRH)

BITS	7	6	5	4	3	2	1	0
FIELD	BRH							
RESET	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	F66H							

BRH = SPI Baud Rate High Byte
Most significant byte, BRG[15:8], of the SPI Baud Rate Generator's reload value.

Table 65. SPI Baud Rate Low Byte Register (SPIBRL)

BITS	7	6	5	4	3	2	1	0
FIELD	BRL							
RESET	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/w
ADDR	F67H							

BRL = SPI Baud Rate Low Byte
Least significant byte, BRG[7:0], of the SPI Baud Rate Generator's reload value.

14. Software responds by setting the STOP bit of the I²C Control register.
15. If no new data is to be sent or address is to be sent, software responds by clearing the TXI bit of the I²C Control register.
16. The I²C Controller completes transmission of the data on the SDA signal.
17. The I²C Controller sends the STOP condition to the I²C bus.

Writing a Transaction with a 10-Bit Address

1. The I²C Controller shifts the I²C Shift register out onto SDA signal.
2. The I²C Controller waits for the slave to send an Acknowledge (by pulling the SDA signal Low). If the slave pulls the SDA signal High (Not-Acknowledge), the I²C Controller sends a Stop signal.
3. If the slave needs to service an interrupt, it pulls the SCL signal low, which halts I²C operation.
4. If there is no other data in the I²C Data register or the STOP bit in the I²C Control register is set by software, then the Stop signal is sent.

The data transfer format for a 10-bit addressed slave is illustrated in the figure below. Shaded regions indicate data transferred from the I²C Controller to slaves and unshaded regions indicate data transferred from the slaves to the I²C Controller.

Figure 80. 10-Bit Addressed Slave Data Transfer Format

The first seven bits transmitted in the first byte are 11110XX. The two bits XX are the two most-significant bits of the 10-bit address. The lowest bit of the first byte transferred is the write signal. The transmit operation is carried out in the same manner as 7-bit addressing.

The data transfer format for a transmit operation on a 10-bit addressed slave is as follows:

1. Software asserts the IEN bit in the I²C Control register.
2. Software asserts the TXI bit of the I²C Control register to enable Transmit interrupts.
3. The I²C interrupt asserts because the I²C Data register is empty.
4. Software responds to the TDRE bit by writing the first slave address byte. The least-significant bit must be 0 for the write operation.
5. Software asserts the START bit of the I²C Control register.
6. The I²C Controller sends the START condition to the I²C slave.

Table 74. DMA*x* Start/Current Address Low Byte Register (DMA*x*START)

BITS	7	6	5	4	3	2	1	0
FIELD	DMA_START							
RESET	X	X	X	X	X	X	X	X
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	FB3H, FHBH							

DMA_START—DMA*x* Start/Current Address Low
These bits, with the four lower bits of the DMA*x*_H register, form the 12-bit Start/Current address. The full 12-bit address is given by {DMA_START_H[3:0], DMA_START[7:0]}.

DMA*x* End Address Low Byte Register

The DMA*x* End Address Low Byte register, in conjunction with the DMA*x*_H register, forms a 12-bit End Address.

Table 75. DMA*x* End Address Low Byte Register (DMA*x*END)

BITS	7	6	5	4	3	2	1	0
FIELD	DMA_END							
RESET	X	X	X	X	X	X	X	X
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	FB4H, FBCH							

DMA_END—DMA*x* End Address Low
These bits, with the four upper bits of the DMA*x*_H register, form a 12-bit address. This address is the ending location of the DMA*x* transfer. The full 12-bit address is given by {DMA_END_H[3:0], DMA_END[7:0]}.

DMA_ADC Address Register

The DMA_ADC Address register points to a block of the Register File to store ADC conversion values as illustrated in Table 76. This register contains the seven most-significant bits of the 12-bit Register File addresses. The five least-significant bits are calculated from the ADC Analog Input number (5-bit base address is equal to twice the ADC Analog Input number). The 10-bit ADC conversion data is stored as two bytes with the most significant byte of the ADC data stored at the even numbered Register File address.

Flash Status Register

The Flash Status register indicates the current state of the Flash Controller. This register can be read at any time. The Read-only Flash Status Register shares its Register File address with the Write-only Flash Control Register.

Table 86. Flash Status Register (FSTAT)

BITS	7	6	5	4	3	2	1	0
FIELD	Reserved		FSTAT					
RESET	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R
ADDR	FF8H							

Reserved
These bits are reserved and must be 0.

FSTAT—Flash Controller Status
000000 = Flash Controller locked.
000001 = First unlock command received.
000010 = Flash Controller unlocked (second unlock command received).
001xxx = Program operation in progress.
010xxx = Page erase operation in progress.
100xxx = Mass erase operation in progress.

Program Memory Address 0000H

Table 90. Option Bits At Program Memory Address 0000H

BITS	7	6	5	4	3	2	1	0
FIELD	WDT_RES	WDT_AO	Reserved			RP	FHSWP	FWP
RESET	U	U	U	U	U	U	U	U
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	Program Memory 0000H							

Note: U = Unchanged by Reset. R/W = Read/Write.

WDT_RES—Watch-Dog Timer Reset
0 = Watch-Dog Timer time-out generates an interrupt request. Interrupts must be globally enabled for the eZ8 CPU to acknowledge the interrupt request.
1 = Watch-Dog Timer time-out causes a Short Reset. This setting is the default for unprogrammed (erased) Flash.

WDT_AO—Watch-Dog Timer Always On
0 = Watch-Dog Timer is automatically enabled upon application of system power. Watch-Dog Timer can not be disabled.
1 = Watch-Dog Timer is enabled upon execution of the WDT instruction. Once enabled, the Watch-Dog Timer can only be disabled by a Reset or Stop Mode Recovery. This setting is the default for unprogrammed (erased) Flash.

Reserved
These Option Bits are reserved for future use and must always be set to 1. This setting is the default for unprogrammed (erased) Flash.

RP—Read Protect
0 = User program code is inaccessible. Limited control features are available through the On-Chip Debugger.
1 = User program code is accessible. All On-Chip Debugger commands are enabled. This setting is the default for unprogrammed (erased) Flash.

- **Write Watchpoint (20H)**—The Write Watchpoint command sets and configures the debug Watchpoint. If the Z8F640x family device is not in Debug mode or the Read Protect Option Bit is enabled, the WPTCTL bits are all set to zero.

```
DBG <-- 20H
DBG <-- WPTCTL[7:0]
DBG <-- WPTADDR[7:0]
DBG <-- WPTDATA[7:0]
```

- **Read Watchpoint (21H)**—The Read Watchpoint command reads the current Watchpoint registers.

```
DBG <-- 21H
DBG --> WPTCTL[7:0]
DBG --> WPTADDR[7:0]
DBG --> WPTDATA[7:0]
```

On-Chip Debugger Control Register Definitions

OCD Control Register

The OCD Control register controls the state of the On-Chip Debugger. This register enters or exits Debug mode and enables the BRK instruction. It can also reset the Z8F640x family device.

A “reset and stop” function can be achieved by writing 81H to this register. A “reset and go” function can be achieved by writing 41H to this register. If the Z8F640x family device is in Debug mode, a “run” function can be implemented by writing 40H to this register.

Table 94. OCD Control Register (OCDCTL)

BITS	7	6	5	4	3	2	1	0
FIELD	DBGMODE	BRKEN	DBGACK	Reserved				RST
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R/W

DBGMODE—Debug Mode
Setting this bit to 1 causes the Z8F640x family device to enter Debug mode. When in Debug mode, the eZ8 CPU stops fetching new instructions. Clearing this bit causes the eZ8 CPU to start running again. This bit is automatically set when a BRK instruction is decoded and Breakpoints are enabled or when a Watchpoint Debug Break is detected. If the Read Protect Option Bit is enabled, this bit can only be cleared by resetting the Z8F640x family device, it cannot be written to 0.
0 = The Z8F640x family device is operating in normal mode.
1 = The Z8F640x family device is in Debug mode.

On-Chip Oscillator

The Z8F640x family devices feature an on-chip oscillator for use with an external 1-20MHz crystal. This oscillator generates the primary system clock for the internal eZ8 CPU and the majority of the on-chip peripherals. Alternatively, the X_{IN} input pin can also accept a CMOS-level clock input signal (32kHz-20MHz). If an external clock generator is used, the X_{OUT} pin must be left unconnected. The Z8F640x family device does ***not*** contain in internal clock divider. The frequency of the signal on the X_{IN} input pin determines the frequency of the system clock. The Z8F640x family device on-chip oscillator does not support external RC networks or ceramic resonators.

20MHz Crystal Oscillator Operation

Figure 90 illustrates a recommended configuration for connection with an external 20MHz, fundamental-mode, parallel-resonant crystal. Recommended crystal specifications are provided in Table 99. Resistor R_1 limits total power dissipation by the crystal. Printed circuit board layout should add no more than 4pF of stray capacitance to either the X_{IN} or X_{OUT} pins. If oscillation does not occur, reduce the values of capacitors C_1 and C_2 to decrease loading.

Figure 92 illustrates the typical current consumption in Halt mode while operating at 25ºC, 3.3V, versus the system clock frequency.

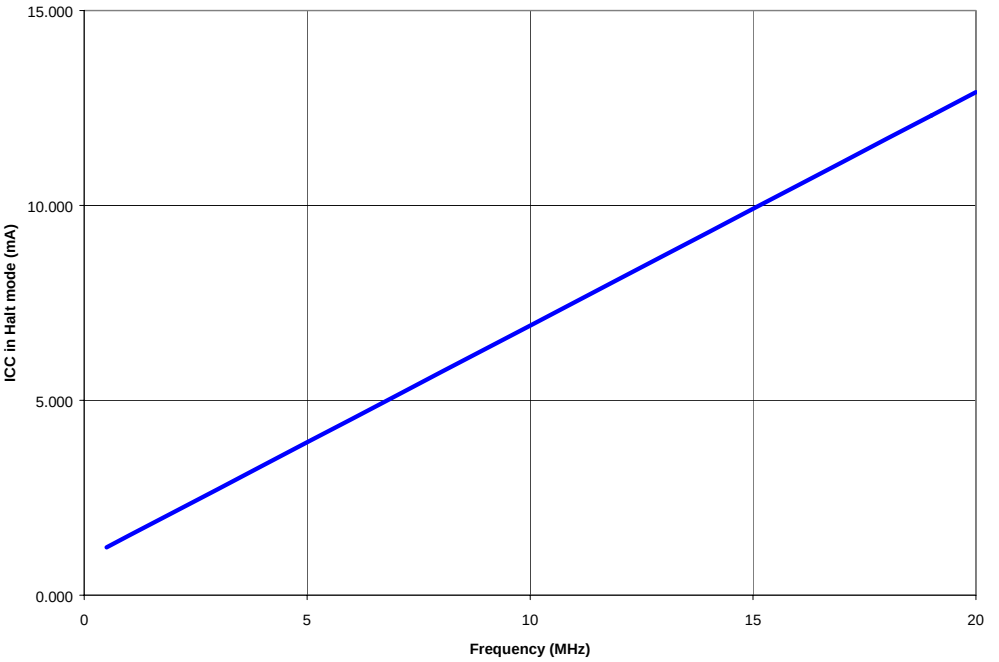

Figure 92. Nominal Halt Mode ICC Versus System Clock Frequency

SPI Slave Mode Timing

Figure 97 and Table 111 provide timing information for the SPI slave mode pins. Timing is shown with SCK rising edge used to source MISO output data, SCK falling edge used to sample MOSI input data.

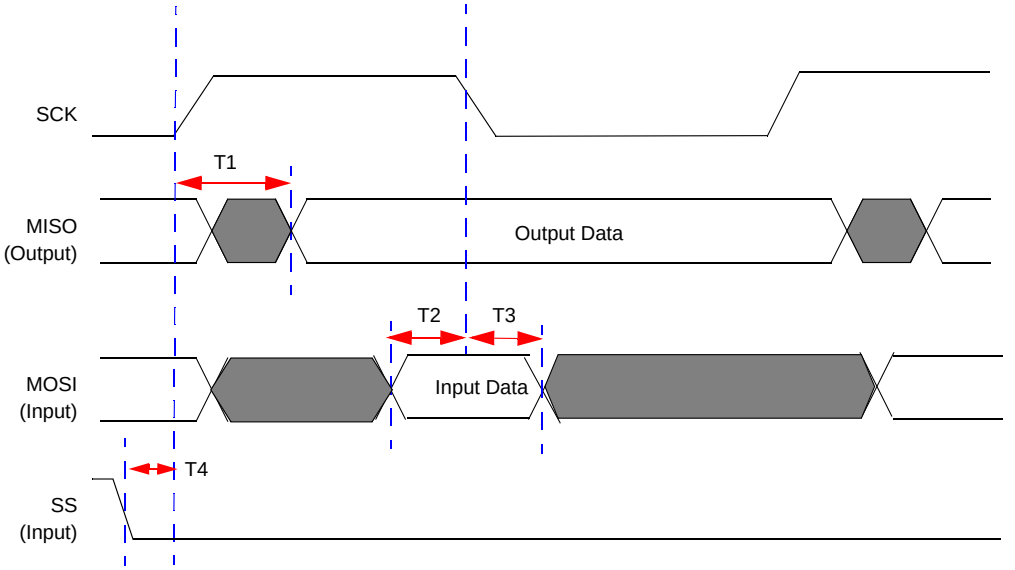

Figure 97. SPI Slave Mode Timing

Table 111. SPI Slave Mode Timing

		Delay (ns)	
Parameter	**Abbreviation**	**Minimum**	**Maximum**
T_1	SCK (transmit edge) to MISO output Valid Delay	2 * Xin period	3 * Xin period + 20 nsec
T_2	MOSI input to SCK (receive edge) Setup Time	0	
T_3	MOSI input to SCK (receive edge) Hold Time	3 * Xin period	
T_4	SS input assertion to SCK setup	1 * Xin period	

Table 127. Opcode Map Abbreviations

Abbreviation	Description	Abbreviation	Description
b	Bit position	IRR	Indirect Register Pair
cc	Condition code	p	Polarity (0 or 1)
X	8-bit signed index or displacement	r	4-bit Working Register
DA	Destination address	R	8-bit register
ER	Extended Addressing register	r1, R1, Ir1, Irr1, IR1, rr1, RR1, IRR1, ER1	Destination address
IM	Immediate data value	r2, R2, Ir2, Irr2, IR2, rr2, RR2, IRR2, ER2	Source address
Ir	Indirect Working Register	RA	Relative
IR	Indirect register	rr	Working Register Pair
Irr	Indirect Working Register Pair	RR	Register Pair

For valuable information about hardware and software development tools, visit the ZiLOG web site at www.zilog.com. The latest released version of ZDS can be downloaded from this site.

Part Number Description

ZiLOG part numbers consist of a number of components, as indicated in the following examples:

ZiLOG Base Products	
Z8	ZiLOG 8-bit microcontroller product
F6	Flash Memory
64	Program Memory Size
01	Device Number
A	Package
N	Pin Count
020	Speed
S	Temperature Range
C	Environmental Flow

Packages	A = LQFP S = SOIC H = SSOP P = PDIP V = PLCC F = QFP
Pin Count	H = 20 pins J = 28 pins M = 40 pins N = 44 pins R = 64 pins S = 68 pins T = 80 pins
Speed	020 = 20MHz
Temperature	S = 0ºC to +70ºC E = -40ºC to +105ºC
Environmental Flow	C = Plastic-Standard

Example: Part number Z8F06401AN020SC is an 8-bit microcontroller product in an LQFP package, using 44 pins, operating with a maximum 20MHz external clock frequency over a 0ºC to +70ºC temperature range and built using the Plastic-Standard environmental flow.
