

Welcome to E-XFL.COM

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Obsolete
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	I ² C, IrDA, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	46
Program Memory Size	48KB (48K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 12x10b
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f4802ar020sc00tr

Figure 61. Z8Fxx03 in 80-Pin Quad Flat Package (QFP)

Table 2. Signal Descriptions (Continued)

Signal Mnemonic	I/O	Description
Reset		
$\overline{\text{RESET}}$	I	RESET. Generates a Reset when asserted (driven Low).
Power Supply		
VDD	I	Power Supply.
AVDD	I	Analog Power Supply.
VSS	I	Ground.
AVSS	I	Analog Ground.

Pin Characteristics

Table 3 provides detailed information on the characteristics for each pin available on the Z8F640x family products. Data in Table 3 is sorted alphabetically by the pin symbol mnemonic.

Table 3. Pin Characteristics of the Z8F640x family

Symbol Mnemonic	Direction	Reset Direction	Active Low or Active High	Tri-State Output	Internal Pull-up or Pull-down	Schmitt Trigger Input	Open Drain Output
AVSS	N/A	N/A	N/A	N/A	No	No	N/A
AVDD	N/A	N/A	N/A	N/A	No	No	N/A
DBG	I/O	I	N/A	Yes	No	Yes	Yes
VSS	N/A	N/A	N/A	N/A	No	No	N/A
PA[7:0]	I/O	I	N/A	Yes	No	Yes	Yes, Programmable
PB[7:0]	I/O	I	N/A	Yes	No	Yes	Yes, Programmable
PC[7:0]	I/O	I	N/A	Yes	No	Yes	Yes, Programmable
PD[7:0]	I/O	I	N/A	Yes	No	Yes	Yes, Programmable
PE7:0]	I/O	I	N/A	Yes	No	Yes	Yes, Programmable

x represents integer 0, 1,... to indicate multiple pins with symbol mnemonics that differ only by the integer

Table 11. Port Alternate Function Mapping (Continued)

Port	Pin	Mnemonic	Alternate Function Description
Port D	PD0	T3IN	Timer 3 In (not available in 40- and 44-pin packages)
	PD1	T3OUT	Timer 3 Out (not available in 40- and 44-pin packages)
	PD2	N/A	No alternate function
	PD3	N/A	No alternate function
	PD4	RXD1 / IRRX1	UART 1 / IrDA 1 Receive Data
	PD5	TXD1 / IRTX1	UART 1 / IrDA 1 Transmit Data
	PD6	$\overline{\text{CTS1}}$	UART 1 Clear to Send
	PD7	RCOUT	Watch-Dog Timer RC Oscillator Output
Port E	PE[7:0]	N/A	No alternate functions
Port F	PF[7:0]	N/A	No alternate functions
Port G	PG[7:0]	N/A	No alternate functions
Port H	PH0	ANA8	ADC Analog Input 8
	PH1	ANA9	ADC Analog Input 9
	PH2	ANA10	ADC Analog Input 10
	PH3	ANA11	ADC Analog Input 11

GPIO Interrupts

Many of the GPIO port pins can be used as interrupt sources. Some port pins may be configured to generate an interrupt request on either the rising edge or falling edge of the pin input signal. Other port pin interrupts generate an interrupt when any edge occurs (both rising and falling). Refer to the **Interrupt Controller** chapter for more information on interrupts using the GPIO pins.

GPIO Control Register Definitions

Four registers for each Port provide access to GPIO control, input data, and output data. Table 12 lists these Port registers. Use the Port A-H Address and Control registers together to provide access to sub-registers for Port configuration and control.

PADDR[7:0]—Port Address

The Port Address selects one of the sub-registers accessible through the Port Control register.

PADDR[7:0]	Port Control sub-register accessible using the Port A-H Control Registers
00H	No function. Provides some protection against accidental Port reconfiguration.
01H	Data Direction
02H	Alternate Function
03H	Output Control (Open-Drain)
04H	High Drive Enable
05H	Stop Mode Recovery Source Enable.
06H-FFH	No function.

Port A-H Control Registers

The Port A-H Control registers set the GPIO port operation. The value in the corresponding Port A-H Address register determines the control sub-registers accessible using the Port A-H Control register (Table 14).

Table 14. Port A-H Control Registers (PxCTL)

BITS	7	6	5	4	3	2	1	0
FIELD	PCTL							
RESET	00H							
R/W	R/W							
ADDR	FD1H, FD5H, FD9H, FDDH, FE1H, FE5H, FE9H, FEDH							

PCTL[7:0]—Port Control

The Port Control register provides access to all sub-registers that configure the GPIO Port operation.

Table 33. IRQ2 Enable High Bit Register (IRQ2ENH)

ADDR	FC8H							

T3ENL—Timer 3 Interrupt Request Enable Low Bit
U1RENL—UART 1 Receive Interrupt Request Enable Low Bit
U1TENL—UART 1 Transmit Interrupt Request Enable Low Bit
DMAENL—DMA Interrupt Request Enable Low Bit
C3ENL—Port C3 Interrupt Request Enable Low Bit
C2ENL—Port C2 Interrupt Request Enable Low Bit
C1ENL—Port C1 Interrupt Request Enable Low Bit
C0ENL—Port C0 Interrupt Request Enable Low Bit

Interrupt Edge Select Register

The Interrupt Edge Select (IRQES) register (Table 35) determines whether an interrupt is generated for the rising edge or falling edge on the selected GPIO Port input pin. The

set to 2-byte transfers, the temporary holding register for the Timer Reload High Byte is not bypassed.

Table 40. Timer 0-3 Reload High Byte Register (TxRH)

ADDR	F03H, F0BH, F13H, F1BH							

TRH and TRL—Timer Reload Register High and Low

These two bytes form the 16-bit Reload value, {TRH[7:0], TRL[7:0]}. This value is used to set the maximum count value which initiates a timer reload to 0001H. In Compare mode, these two bytes form the 16-bit Compare value.

UART

Overview

The Universal Asynchronous Receiver/Transmitter (UART) is a full-duplex communication channel capable of handling asynchronous data transfers. The Z8F640x family device contains two fully independent UARTs. The UART uses a single 8-bit data mode with selectable parity. Features of the UART include:

- 8-bit asynchronous data transfer
- Selectable even- and odd-parity generation and checking
- Option of one or two Stop bits
- Separate transmit and receive interrupts
- Framing, parity, overrun and break detection
- Separate transmit and receive enables
- Selectable 9-bit multiprocessor (9-bit) mode
- 16-bit Baud Rate Generator (BRG)

Architecture

The UART consists of three primary functional blocks: transmitter, receiver, and baud rate generator. The UART's transmitter and receiver function independently, but employ the same baud rate and data format. Figure 67 illustrates the UART architecture.

1. Disable the SPI by clearing the `SPIEN` bit in the SPI Control register to 0.
2. Load the desired 16-bit count value into the SPI Baud Rate High and Low Byte registers.
3. Enable the Baud Rate Generator timer function and associated interrupt by setting the `BIRQ` bit in the SPI Control register to 1.

SPI Control Register Definitions

SPI Data Register

The SPI Data register stores both the outgoing (transmit) data and the incoming (received) data. Reads from the SPI Data register always return the current contents of the 8-bit shift register.

With the SPI configured as a Master, writing a data byte to this register initiates the data transmission. With the SPI configured as a Slave, writing a data byte to this register loads the shift register in preparation for the next data transfer with the external Master. In either the Master or Slave modes, if a transmission is already in progress, writes to this register are ignored and the Overrun error flag, `OVR`, is set in the SPI Status register.

When the character length is less than 8 bits (as set by the `NUMBITS` field in the SPI Mode register), the transmit character must be left justified in the SPI Data register. A received character of less than 8 bits will be right justified. For example, if the SPI is configured for 4-bit characters, the transmit characters must be written to `SPIDATA[7:4]` and the received characters are read from `SPIDATA[3:0]`.

Table 60. SPI Data Register (SPIDATA)

BITS	7	6	5	4	3	2	1	0
FIELD	DATA							
RESET	X	X	X	X	X	X	X	X
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
ADDR	F60H							

DATA—Data
Transmit and/or receive data.

Figure 83. Analog-to-Digital Converter Block Diagram

Operation

Automatic Power-Down

If the ADC is idle (no conversions in progress) for 160 consecutive system clock cycles, portions of the ADC are automatically powered-down. From this power-down state, the ADC requires 40 system clock cycles to power-up. The ADC powers up when a conversion is requested using the ADC Control register.

Single-Shot Conversion

When configured for single-shot conversion, the ADC performs a single analog-to-digital conversion on the selected analog input channel. After completion of the conversion, the ADC shuts down. The steps for setting up the ADC and initiating a single-shot conversion are as follows:

Flash Memory

Overview

The Z8F640x family features up to 64KB (65,536 bytes) of non-volatile Flash memory with read/write/erase capability. The Flash Memory can be programmed and erased in-circuit by either user code or through the On-Chip Debugger.

The Flash memory array is arranged in pages with 512 bytes per page. The 512-byte page is the minimum Flash block size that can be erased. Each page is divided into 8 rows of 64 bytes. The Flash memory also contains a High Sector that can be enabled for writes and erase separately from the rest of the Flash array. The first 2 bytes of the Flash Program memory are used as Option Bits. Refer to the **Option Bits** chapter for more information on their operation.

Table 83 describes the Flash memory configuration for each device in the Z8F640x family. Figure 84 illustrates the Flash memory arrangement.

Table 83. Z8F640x family Flash Memory Configurations

Part Number	Flash Size KB (Bytes)	Flash Pages	Program Memory Addresses	Flash High Sector Size KB (Bytes)	High Sector Addresses
Z8F160x	16 (16,384)	32	0000H - 3FFFH	1 (1024)	3C00H - 3FFFH
Z8F240x	24 (24,576)	48	0000H - 5FFFH	2 (2048)	5800H - 5FFFH
Z8F320x	32 (32,768)	64	0000H - 7FFFH	2 (2048)	7800H - 7FFFH
Z8F480x	48 (49,152)	96	0000H - BFFFH	4 (4096)	B000H - BFFFH
Z8F640x	64 (65,536)	128	0000H - FFFFH	8 (8192)	E000H - FFFFH

If the OCD receives a Serial Break (nine or more continuous bits Low) the Auto-Baud Detector/Generator resets. The Auto-Baud Detector/Generator can then be reconfigured by sending 80H.

OCD Serial Errors

The On-Chip Debugger can detect any of the following error conditions on the DBG pin:

- Serial Break (a minimum of nine continuous bits Low)
- Framing Error (received Stop bit is Low)
- Transmit Collision (OCD and host simultaneous transmission detected by the OCD)

When the OCD detects one of these errors, it aborts any command currently in progress, transmits a four character long Serial Break back to the host, and resets the Auto-Baud Detector/Generator. A Framing Error or Transmit Collision may be caused by the host sending a Serial Break to the OCD. Because of the open-drain nature of the interface, returning a Serial Break back to the host only extends the length of the Serial Break if the host releases the Serial Break early.

The host should transmit a Serial Break on the DBG pin when first connecting to the Z8F640x family device or when recovering from an error. A Serial Break from the host resets the Auto-Baud Generator/Detector but does not reset the OCD Control register. A Serial Break leaves the Z8F640x family device in Debug mode if that is the current mode. The OCD is held in Reset until the end of the Serial Break when the DBG pin returns High. Because of the open-drain nature of the DBG pin, the host can send a Serial Break to the OCD even if the OCD is transmitting a character.

Breakpoints

Execution Breakpoints are generated using the BRK instruction (opcode 00H). When the eZ8 CPU decodes a BRK instruction, it signals the On-Chip Debugger. If Breakpoints are enabled, the OCD enters Debug mode and idles the eZ8 CPU. If Breakpoints are not enabled, the OCD ignores the BRK signal and the BRK instruction operates as an NOP.

Breakpoints in Flash Memory

The BRK instruction is opcode 00H, which corresponds to the fully programmed state of a byte in Flash memory. To implement a Breakpoint, write 00H to the desired address, overwriting the current instruction. To remove a Breakpoint, the corresponding page of Flash memory must be erased and reprogrammed with the original data.

Watchpoints

The On-Chip Debugger can set one Watchpoint to cause a Debug Break. The Watchpoint identifies a single Register File address. The Watchpoint can be set to break on reads and/or writes of the selected Register File address. Additionally, the Watchpoint can be configured to break only when a specific data value is read and/or written from the specified reg-

AC Characteristics

The section provides information on the AC characteristics and timing of the Z8 Encore!™. All AC timing information assumes a standard load of 50pF on all outputs.

Table 102. AC Characteristics

Symbol	Parameter	$V_{DD} = 3.0 - 3.6V$ $T_A = -40^{\circ}C \text{ to } 105^{\circ}C$		Units	Conditions
		Minimum	Maximum		
F _{sysclk}	System Clock Frequency	–	20.0	MHz	Read-only from Flash memory.
		0.032768	20.0	MHz	Program or erasure of the Flash memory.
F _{XTAL}	Crystal Oscillator Frequency	1.0	20.0	MHz	System clock frequencies below the crystal oscillator minimum require an external clock driver.
T _{XIN}	System Clock Period	50	–	ns	$T_{CLK} = 1/F_{sysclk}$
T _{XINH}	System Clock High Time	20	30	ns	$T_{CLK} = 50ns$
T _{XINL}	System Clock Low Time	20	30	ns	$T_{CLK} = 50ns$
T _{XINR}	System Clock Rise Time	–	3	ns	$T_{CLK} = 50ns$
T _{XINF}	System Clock Fall Time	–	3	ns	$T_{CLK} = 50ns$

General Purpose I/O Port Input Data Sample Timing

Figure 93 illustrates timing of the GPIO Port input sampling. The input value on a GPIO Port pin is sampled on the rising edge of the system clock. The Port value is then available to the eZ8 CPU on the second rising clock edge following the change of the Port value.

Figure 93. Port Input Sample Timing

Table 107. GPIO Port Input Timing

Parameter	Abbreviation	Delay (ns)	
		Minimum	Maximum
T_{S_PORT}	Port Input Transition to XIN Rise Setup Time (Not pictured)	5	–
T_{H_PORT}	XIN Rise to Port Input Transition Hold Time (Not pictured)	5	–
T_{SMR}	GPIO Port Pin Pulse Width to Insure Stop Mode Recovery (for GPIO Port Pins enabled as SMR sources)	1 μ s

Figure 101. First Opcode Map

- SDA and SCL (IrDA) signals 111
- second opcode map after 1FH 205
- serial clock 101
- serial peripheral interface (SPI) 99
- set carry flag 188, 189
- set register pointer 189
- shift right arithmetic 191
- shift right logical 191
- signal descriptions 13
- single assertion (pulse) interrupt sources 47
- single-shot conversion (ADC) 133
- SIO 5
- slave data transfer formats (I2C) 114
- slave select 102
- software trap 190
- source operand 185
- SP 185
- SPI
 - architecture 99
 - baud rate generator 105
 - baud rate high and low byte register 110
 - clock phase 102
 - configured as slave 100
 - control register 107
 - control register definitions 106
 - data register 106
 - error detection 105
 - interrupts 105
 - mode fault error 105
 - mode register 109
 - multi-master operation 104
 - operation 100
 - overflow error 105
 - signals 101
 - single master, multiple slave system 100
 - single master, single slave system 99
 - status register 108
 - timing, PHASE = 0 103
 - timing, PHASE=1 104
- SPI controller signals 13
- SPI mode (SPIMODE) 109
- SPIBRH register 110
- SPIBRL register 110
- SPICTL register 107

- SPIDATA register 106
- SPIMODE register 109
- SPISTAT register 108
- SRA 191
- src 185
- SRL 191
- SRP 189
- SS, SPI signal 101
- stack pointer 185
- status register, I2C 118
- STOP 189
- stop mode 31, 189
- stop mode recovery
 - sources 29
 - using a GPIO port pin transition 30
 - using watch-dog timer time-out 29
- SUB 188
- subtract 188
- subtract - extended addressing 188
- subtract with carry 188
- subtract with carry - extended addressing 188
- SUBX 188
- SWAP 191
- swap nibbles 191
- symbols, additional 185
- system and short resets 26

T

- TCM 188
- TCMX 188
- technical support 213
- test complement under mask 188
- test under mask 188
- timer signals 14
- timers 5, 57
 - architecture 57
 - block diagram 58
 - capture mode 62, 71
 - capture/compare mode 65, 71
 - compare mode 63, 71
