Intel - 5SGSMD4E2H29I3LN Datasheet

Welcome to <u>E-XFL.COM</u>

Understanding <u>Embedded - FPGAs (Field</u> <u>Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	135840
Number of Logic Elements/Cells	360000
Total RAM Bits	19456000
Number of I/O	360
Number of Gates	
Voltage - Supply	0.82V ~ 0.88V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	780-BBGA, FCBGA
Supplier Device Package	780-HBGA (33x33)
Purchase URL	https://www.e-xfl.com/product-detail/intel/5sgsmd4e2h29i3ln

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

			Calibration Accuracy					
Symbol	Description	Conditions	Conditions C1 C2,12 C3,13, I3YY C4,14		Unit			
50-Ω R _S	Internal series termination with calibration (50- Ω setting)	V _{CCI0} = 3.0, 2.5, 1.8, 1.5, 1.2 V	±15	±15	±15	±15	%	
34- Ω and 40- Ω R _S	Internal series termination with calibration (34- Ω and 40- Ω setting)	V _{CCI0} = 1.5, 1.35, 1.25, 1.2 V	±15	±15	±15	±15	%	
48-Ω, 60-Ω, 80-Ω, and 240-Ω R _S	Internal series termination with calibration (48- Ω , 60- Ω , 80- Ω , and 240- Ω setting)	V _{CCI0} = 1.2 V	±15	±15	±15	±15	%	
50-Ω R _T	Internal parallel termination with calibration (50-Ω setting)	V _{CCI0} = 2.5, 1.8, 1.5, 1.2 V	-10 to +40	-10 to +40	-10 to +40	-10 to +40	%	
20-Ω, 30-Ω, 40-Ω,60-Ω, and 120-Ω R _T	Internal parallel termination with calibration ($20 - \Omega$, $30 - \Omega$, $40 - \Omega$, $60 - \Omega$, and $120 - \Omega$ setting)	V _{CCI0} = 1.5, 1.35, 1.25 V	-10 to +40	-10 to +40	-10 to +40	-10 to +40	%	
60- $Ω$ and 120- $Ω$ R _T	Internal parallel termination with calibration (60-Ω and 120-Ω setting)	V _{CCI0} = 1.2	-10 to +40	-10 to +40	-10 to +40	-10 to +40	%	
$25-\Omega \\ R_{S_left_shift}$	Internal left shift series termination with calibration ($25-\Omega$ R _{S_left_shift} setting)	V _{CCI0} = 3.0, 2.5, 1.8, 1.5, 1.2 V	±15	±15	±15	±15	%

Table 13. OCT Variation after Power-Up Calibration for Stratix V Devices (Part 2 of 2)⁽¹⁾

Note to Table 13:

(1) Valid for a V_{CCIO} range of $\pm 5\%$ and a temperature range of 0° to 85°C.

Pin Capacitance

Table 14 lists the Stratix V device family pin capacitance.

Table 14. Pin Capacitance for Stratix V Devices

Symbol	Description	Value	Unit
CIOTB	Input capacitance on the top and bottom I/O pins	6	pF
C _{IOLR}	Input capacitance on the left and right I/O pins	6	рF
C _{OUTFB}	Input capacitance on dual-purpose clock output and feedback pins	6	pF

Hot Socketing

Table 15 lists the hot socketing specifications for Stratix V devices.

Symbol	Description	Maximum
I _{IOPIN (DC)}	DC current per I/O pin	300 μA
I _{IOPIN (AC)}	AC current per I/O pin	8 mA ⁽¹⁾
IXCVR-TX (DC)	DC current per transceiver transmitter pin	100 mA
IXCVR-RX (DC)	DC current per transceiver receiver pin	50 mA

Note to Table 15:

(1) The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, $|I_{10PIN}| = C dv/dt$, in which C is the I/O pin capacitance and dv/dt is the slew rate.

Switching Characteristics

This section provides performance characteristics of the Stratix V core and periphery blocks.

These characteristics can be desigated as Preliminary or Final.

Preliminary characteristics are created using simulation results, process data, and other known parameters. The title of these tables show the designation as "Preliminary."

Final numbers are based on actual silicon characterization and testing. The numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. There are no designations on finalized tables.

Transceiver Performance Specifications

This section describes transceiver performance specifications.

Table 23 lists the Stratix V GX and GS

Symbol/	Conditions	S	Transceive peed Grade	2	S	Fransceive Deed Grade	r 3	Unit
Description		Min	Тур	Max	Min	Тур	Max

Table 29 shows the V_{OD} settings for the GT channel.

Symbol	V _{OD} Setting	V _{od} Value (mV)
	0	0
	1	200
V., differential neak to neak typical (1)	2	400
The fine contrar hear to hear the field to	3	600
	4	800
	5	1000

Note:

(1) Refer to Figure 4.

Table 31. PLL Specifications for Stratix V Devices (Part 3 of 3)

Symbol	Parameter	Min	Тур	Max	Unit
f _{RES}	Resolution of VCO frequency ($f_{INPFD} = 100 \text{ MHz}$)	390625	5.96	0.023	Hz

Notes to Table 31:

(1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.

(2) This specification is limited by the lower of the two: I/O f_{MAX} or f_{OUT} of the PLL.

- (3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source < 120 ps.
- (4) f_{REF} is fIN/N when N = 1.
- (5) Peak-to-peak jitter with a probability level of 10⁻¹² (14 sigma, 99.9999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 44 on page 52.
- (6) The cascaded PLL specification is only applicable with the following condition: a. Upstream PLL: 0.59Mhz ≤ Upstream PLL BW < 1 MHz b. Downstream PLL: Downstream PLL BW > 2 MHz
- (7) High bandwidth PLL settings are not supported in external feedback mode.
- (8) The external memory interface clock output jitter specifications use a different measurement method, which is available in Table 42 on page 50.
- (9) The VCO frequency reported by the Quartus II software in the PLL Usage Summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the f_{VCO} specification.
- (10) This specification only covers fractional PLL for low bandwidth. The f_{VCO} for fractional value range 0.05 0.95 must be \geq 1000 MHz, while f_{VCO} for fractional value range 0.20 0.80 must be \geq 1200 MHz.
- (11) This specification only covered fractional PLL for low bandwidth. The f_{VC0} for fractional value range 0.05-0.95 must be \geq 1000 MHz.
- (12) This specification only covered fractional PLL for low bandwidth. The f_{VC0} for fractional value range 0.20-0.80 must be \geq 1200 MHz.

DSP Block Specifications

Table 32 lists the Stratix V DSP block performance specifications.

	True dual port, all supported widths	0	1	700	700	650	550	700	500	450	MHz
	ROM, all supported widths	0	1	700	700	650	550	700	500	450	MHz

Table 33. Memory Block Performance Specifications for Stratix V Devices ^{(1), (2)} (Part 2 of 2)

Notes to Table 33:

(1) To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL set to **50**% output duty cycle. Use the Quartus II software to report timing for this and other memory block clocking schemes.

(2) When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in F_{MAX}.

(3) The F_{MAX} specification is only achievable with Fitter options, MLAB Implementation In 16-Bit Deep Mode enabled.

Temperature Sensing Diode Specifications

Table 34 lists the internal TSD specification.

Table 34. Internal Temperature Sensing Diode Specification

Temperature Range	Accuracy	Offset Calibrated Option	Sampling Rate	Conversion Time	Resolution	Minimum Resolution with no Missing Codes
-40°C to 100°C	±8°C	No	1 MHz, 500 KHz	< 100 ms	8 bits	8 bits

Table 35 lists the specifications for the Stratix V external temperature sensing diode.

Table 35.	External	Temperature	Sensing Dic	de Specifica	ations for Stratix	V Devices
-----------	----------	-------------	-------------	--------------	--------------------	-----------

Description	Min	Тур	Max	Unit
I _{bias} , diode source current	8	—	200	μA
V _{bias,} voltage across diode	0.3	—	0.9	V
Series resistance	—	_	< 1	Ω
Diode ideality factor	1.006	1.008	1.010	_

Figure 7 shows the dynamic phase alignment (DPA) lock time specifications with the DPA PLL calibration option enabled.

Figure 7. DPA Lock Time Specification with DPA PLL Calibration Enabled

rx_reset			
rx_dpa_locked			<u> </u>
			-

Table 37 lists the DPA lock time specifications for Stratix V devices.

Table 37. DPA Lock Time Specifications for Stratix V GX Devices Only (1), (2), (3)

Standard	Training Pattern	Number of Data Transitions in One Repetition of the Training Pattern	Number of Repetitions per 256 Data Transitions ⁽⁴⁾	Maximum
SPI-4	00000000001111111111	2	128	640 data transitions
Parallel Rapid I/O	00001111	2	128	640 data transitions
	10010000	4	64	640 data transitions
Miccollapsouc	10101010	8	32	640 data transitions
Wiscenareous	01010101	8	32	640 data transitions

Notes to Table 37:

(1) The DPA lock time is for one channel.

(2) One data transition is defined as a 0-to-1 or 1-to-0 transition.

(3) The DPA lock time stated in this table applies to both commercial and industrial grade.

(4) This is the number of repetitions for the stated training pattern to achieve the 256 data transitions.

Figure 8 shows the **LVDS** soft-clock data recovery (CDR)/DPA sinusoidal jitter tolerance specification for a data rate \geq 1.25 Gbps. Table 38 lists the **LVDS** soft-CDR/DPA sinusoidal jitter tolerance specification for a data rate \geq 1.25 Gbps.

Family	Device	Package	Configuration .rbf Size (bits)	IOCSR .rbf Size (bits) ^{(4), (5)}
Stratix V E ⁽¹⁾	5SEE9	—	342,742,976	700,888
	5SEEB	—	342,742,976	700,888

Table 47. Uncompressed .rbf Sizes for Stratix V Devices

Notes to Table 47:

(1) Stratix V E devices do not have PCI Express® (PCIe®) hard IP. Stratix V E devices do not support the CvP configuration scheme.

(2) 36-transceiver devices.

(3) 24-transceiver devices.

(4) File size for the periphery image.

(5) The IOCSR .rbf size is specifically for the CvP feature.

Use the data in Table 47 to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal (.hex) or tabular text file (.ttf) format, have different file sizes. For the different types of configuration file and file sizes, refer to the Quartus II software. However, for a specific version of the Quartus II software, any design targeted for the same device has the same uncompressed configuration file size. If you are using compression, the file size can vary after each compilation because the compression ratio depends on your design.

• For more information about setting device configuration options, refer to *Configuration, Design Security, and Remote System Upgrades in Stratix V Devices.* For creating configuration files, refer to the *Quartus II Help.*

Table 48 lists the minimum configuration time estimates for Stratix V devices.

Table 48. Minimum Configuration Time Estimation for Stratix V Devi

	Marchar		Active Serial (1))	Fast Passive Parallel ⁽²⁾			
Variant	Code	Width	DCLK (MHz)	Min Config Time (s)	Width	DCLK (MHz)	Min Config Time (s)	
	٨٥	4	100	0.534	32	100	0.067

FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the DCLK-to-DATA[] ratio is 1.

Notes to Figure 12:

- (1) Use this timing waveform when the DCLK-to-DATA [] ratio is 1.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nstatus low for the time of the POR delay.
- (4) After power-up, before and during configuration, CONF_DONE is low.
- (5) Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
- (6) For FPP ×16, use DATA [15..0]. For FPP ×8, use DATA [7..0]. DATA [31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.
- (7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF_DONE is released high when the Stratix V device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (8) After the option bit to enable the INIT_DONE pin is configured into the device, the INIT DONE goes low.

Table 50 lists the timing parameters for Stratix V devices for FPP configuration when the DCLK-to-DATA[] ratio is 1.

Table 50. FPP Timing Parameters for Stratix V Devices (1)

Symbol	Parameter	Minimum	Maximum	Units
t _{CF2CD}	nCONFIG low to CONF_DONE low	—	600	ns
t _{CF2ST0}	nCONFIG low to nSTATUS low		600	ns
t _{CFG}	nCONFIG low pulse width	2		μS
t _{status}	nSTATUS low pulse width	268	1,506 ⁽²⁾	μS
t _{CF2ST1}	nCONFIG high to nSTATUS high	—	1,506 ⁽³⁾	μS
t _{CF2CK} (6)	nCONFIG high to first rising edge on DCLK	1,506		μS
t _{ST2CK} (6)	nSTATUS high to first rising edge of DCLK	2		μS
t _{DSU}	DATA [] setup time before rising edge on DCLK	5.5	_	ns
t _{DH}	DATA [] hold time after rising edge on DCLK	0	_	ns
t _{CH}	DCLK high time	$0.45\times1/f_{MAX}$		S
t _{CL}	DCLK low time	$0.45\times1/f_{MAX}$	_	S
t _{CLK}	DCLK period	1/f _{MAX}		S
4	DCLK frequency (FPP ×8/×16)	—	125	MHz
IMAX	DCLK frequency (FPP ×32)	—	100	MHz
t _{CD2UM}	CONF_DONE high to user mode ⁽⁴⁾	175	437	μS
+	CONTR DOWN high to CT WARD analysis	4 × maximum		
LCD2CU	CONF_DONE HIGH to CLEOSE enabled	DCLK period	—	_
t _{cD2UMC}	CONF_DONE high to user mode with CLKUSR option on	$\begin{array}{c} t_{\text{CD2CU}} + \\ (8576 \times \text{CLKUSR} \\ \text{period}) \ ^{(5)} \end{array}$		_

Notes to Table 50:

(1) Use these timing parameters when the decompression and design security features are disabled.

(2) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

(3) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.

- (4) The minimum and maximum numbers apply only if you chose the internal oscillator as the clock source for initializing the device.
- (5) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.
- (6) If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.

FPP Configuration Timing when DCLK-to-DATA [] > 1

Figure 13 shows the timing waveform for FPP configuration when using a MAX II device, MAX V device, or microprocessor as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is more than 1.

Symbol	Parameter	Minimum	Maximum	Units
t _{CD2UM}	CONF_DONE high to user mode (3)	175	437	μS
t _{CD2CU}	CONF_DONE high to CLKUSR enabled	4 × maximum DCLK period	_	—
t _{CD2UMC}	CONF_DONE high to user mode with CLKUSR option on	t _{cd2cu} + (8576 × clkusr period)	_	—

Table 53. AS Timing Parameters for AS \times 1 and AS \times 4 Configurations in Stratix V Devices ^{(1), (2)} (Part 2 of 2)

Notes to Table 53:

(1) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

(2) t_{CF2CD}, t_{CF2ST0}, t_{CF2ST0}, t_{CF6}, t_{STATUS}, and t_{CF2ST1} timing parameters are identical to the timing parameters for PS mode listed in Table 54 on page 63.

(3) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on this pin, refer to the Initialization section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

Passive Serial Configuration Timing

Figure 15 shows the timing waveform for a passive serial (PS) configuration when using a MAX II device, MAX V device, or microprocessor as an external host.

Figure 15. PS Configuration Timing Waveform ⁽¹⁾

Notes to Figure 15:

- (1) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (2) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (3) After power-up, before and during configuration, CONF DONE is low.
- (4) Do not leave DCLK floating after configuration. You can drive it high or low, whichever is more convenient.
- (5) DATAO is available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings in the **Device and Pins Option**.
- (6) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF_DONE is released high after the Stratix V device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (7) After the option bit to enable the INIT DONE pin is configured into the device, the INIT DONE goes low.

Table 60. Glossary (Part 2 of 4)

Letter	Subject	Definitions
G H I	JTAG Timing Specifications	High-speed I/O block—Deserialization factor (width of parallel data bus). JTAG Timing Specifications: TMS
K L M N O		
Ρ	PLL Specifications	Diagram of PLL Specifications (1)
Q	_	—
R	RL	Receiver differential input discrete resistor (external to the Stratix V device).

Table 60.	Glossary	(Part 3 of 4)
-----------	----------	---------------

Letter	Subject	Definitions		
S	SW (sampling window)	Timing Diagram—the period of time during which the data must be valid in order to capture it correctly. The setup and hold times determine the ideal strobe position within the sampling window, as shown: Bit Time 0.5 x TCCS RSKM Sampling Window RSKM 0.5 x TCCS RSKM		
	Single-ended voltage referenced I/O standard	The JEDEC standard for SSTL and HSTL I/O defines both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state. The new logic state is then maintained as long as the input stays beyond the DC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing: <i>Single-Ended Voltage Referenced I/O Standard</i> 		
	t _C	High-speed receiver and transmitter input and output clock period.		
	TCCS (channel- to-channel-skew)	The timing difference between the fastest and slowest output edges, including t_{CO} variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the <i>Timing Diagram</i> figure under SW in this table).		
	t _{DUTY}	High-speed I/O block—Duty cycle on the high-speed transmitter output clock.		
т		Timing Unit Interval (TUI) The timing budget allowed for skew, propagation delays, and the data sampling window.		
		$(TUI = 1/(receiver input clock frequency multiplication factor) = t_C/W)$		
	t _{FALL}	Signal high-to-low transition time (80-20%)		
	t _{INCCJ}	Cycle-to-cycle jitter tolerance on the PLL clock input.		
	t _{outpj_i0}	Period jitter on the general purpose I/O driven by a PLL.		
	t _{outpj_dc}	Period jitter on the dedicated clock output driven by a PLL.		
	t _{RISE}	Signal low-to-high transition time (20-80%)		
U	—	_		

Letter	Subject	Definitions
	V _{CM(DC)}	DC common mode input voltage.
	V _{ICM}	Input common mode voltage—The common mode of the differential signal at the receiver.
	V _{ID}	Input differential voltage swing—The difference in voltage between the positive and complementary conductors of a differential transmission at the receiver.
	V _{DIF(AC)}	AC differential input voltage—Minimum AC input differential voltage required for switching.
	V _{DIF(DC)}	DC differential input voltage— Minimum DC input differential voltage required for switching.
	V _{IH}	Voltage input high—The minimum positive voltage applied to the input which is accepted by the device as a logic high.
	V _{IH(AC)}	High-level AC input voltage
	V _{IH(DC)}	High-level DC input voltage
V	V _{IL}	Voltage input low—The maximum positive voltage applied to the input which is accepted by the device as a logic low.
	V _{IL(AC)}	Low-level AC input voltage
	V _{IL(DC)}	Low-level DC input voltage
	V _{OCM}	Output common mode voltage—The common mode of the differential signal at the transmitter.
	V _{OD}	Output differential voltage swing—The difference in voltage between the positive and complementary conductors of a differential transmission at the transmitter.
	V _{SWING}	Differential input voltage
	V _X	Input differential cross point voltage
	V _{OX}	Output differential cross point voltage
W	W	High-speed I/O block—clock boost factor
