Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Table 5 lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% of the duty cycle. For example, a signal that overshoots to 3.95 V can be at 3.95 V for only ~21% over the lifetime of the device; for a device lifetime of 10 years, the overshoot duration amounts to ~2 years.

DC Characteristics

This section lists the supply current, I/O pin leakage current, input pin capacitance, on-chip termination tolerance, and hot socketing specifications.

Supply Current

Supply current is the current drawn from the respective power rails used for power budgeting. Use the Excel-based Early Power Estimator (EPE) to get supply current estimates for your design because these currents vary greatly with the resources you use.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

POR Delay Specification

Power-on reset (POR) delay is defined as the delay between the time when all the power supplies monitored by the POR circuitry reach the minimum recommended operating voltage to the time when the `nSTATUS` is released high and your device is ready to begin configuration.

For more information about the POR delay, refer to the *Hot Socketing and Power-On Reset in Stratix V Devices* chapter.

Table 45 lists the fast and standard POR delay specification.

Table 45. Fast and Standard POR Delay Specification (1)

POR Delay	Minimum	Maximum
Fast	4 ms	12 ms
Standard	100 ms	300 ms

Note to Table 45:

(1) You can select the POR delay based on the `MSEL` settings as described in the MSEL Pin Settings section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.

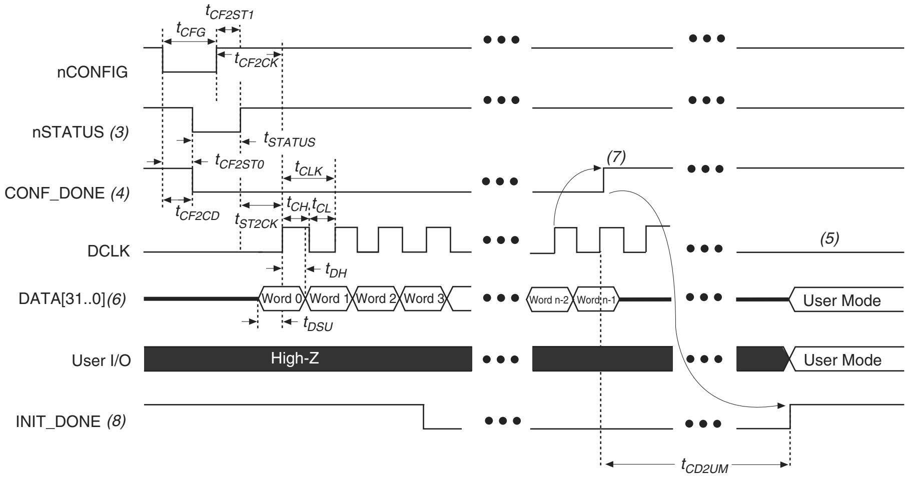
FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the `DCLK`-to-`DATA[]` ratio is 1.

Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 *(1), (2)*



Notes to Figure 12:

(1) Use this timing waveform when the `DCLK`-to-`DATA[]` ratio is 1.

(2) The beginning of this waveform shows the device in user mode. In user mode, `nCONFIG`, `nSTATUS`, and `CONF_DONE` are at logic-high levels. When `nCONFIG` is pulled low, a reconfiguration cycle begins.

(3) After power-up, the Stratix V device holds `nSTATUS` low for the time of the POR delay.

(4) After power-up, before and during configuration, `CONF_DONE` is low.

(5) Do not leave `DCLK` floating after configuration. `DCLK` is ignored after configuration is complete. It can toggle high or low if required.

(6) For FPP ×16, use `DATA[15..0]`. For FPP ×8, use `DATA[7..0]`. `DATA[31..0]` are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.

(7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. `CONF_DONE` is released high when the Stratix V device receives all the configuration data successfully. After `CONF_DONE` goes high, send two additional falling edges on `DCLK` to begin initialization and enter user mode.

(8) After the option bit to enable the `INIT_DONE` pin is configured into the device, the `INIT_DONE` goes low.

Table 50 lists the timing parameters for Stratix V devices for FPP configuration when the `DCLK`-to-`DATA[]` ratio is 1.

Table 50. FPP Timing Parameters for Stratix V Devices *(1)*

t_{CL}	`DCLK` low time	$0.45 \times 1/f_{MAX}$	—	s
t_{CLK}	`DCLK` period	$1/f_{MAX}$	—	s
f_{MAX}	`DCLK` frequency (FPP ×8/×16)	—	125	MHz
	`DCLK` frequency (FPP ×32)	—	100	MHz
t_{CD2UM}	`CONF_DONE` high to user mode *(4)*	175	437	µs
t_{CD2CU}	`CONF_DONE` high to `CLKUSR` enabled	4 × maximum `DCLK` period	—	—
t_{CD2UMC}	`CONF_DONE` high to user mode with `CLKUSR` option on	t_{CD2CU} + (8576 × `CLKUSR` period) *(5)*	—	—

Notes to Table 50:

(1) Use these timing parameters when the decompression and design security features are disabled.

(2) This value is applicable if you do not delay configuration by extending the `nCONFIG` or `nSTATUS` low pulse width.

(3) This value is applicable if you do not delay configuration by externally holding the `nSTATUS` low.

(4) The minimum and maximum numbers apply only if you chose the internal oscillator as the clock source for initializing the device.

(5) To enable the `CLKUSR` pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

(6) If `nSTATUS` is monitored, follow the t_{ST2CK} specification. If `nSTATUS` is not monitored, follow the t_{CF2CK} specification.

FPP Configuration Timing when DCLK-to-DATA [] > 1

Figure 13 shows the timing waveform for FPP configuration when using a MAX II device, MAX V device, or microprocessor as an external host. This waveform shows timing when the `DCLK`-to-`DATA[]` ratio is more than 1.

Table 53. AS Timing Parameters for AS ×1 and AS ×4 Configurations in Stratix V Devices *(1), (2)* **(Part 2 of 2)**

Symbol	Parameter	Minimum	Maximum	Units
t_{CD2UM}	`CONF_DONE` high to user mode *(3)*	175	437	µs
t_{CD2CU}	`CONF_DONE` high to `CLKUSR` enabled	4 × maximum `DCLK` period	—	—
t_{CD2UMC}	`CONF_DONE` high to user mode with `CLKUSR` option on	t_{CD2CU} + (8576 × `CLKUSR` period)	—	—

Notes to Table 53:

(1) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

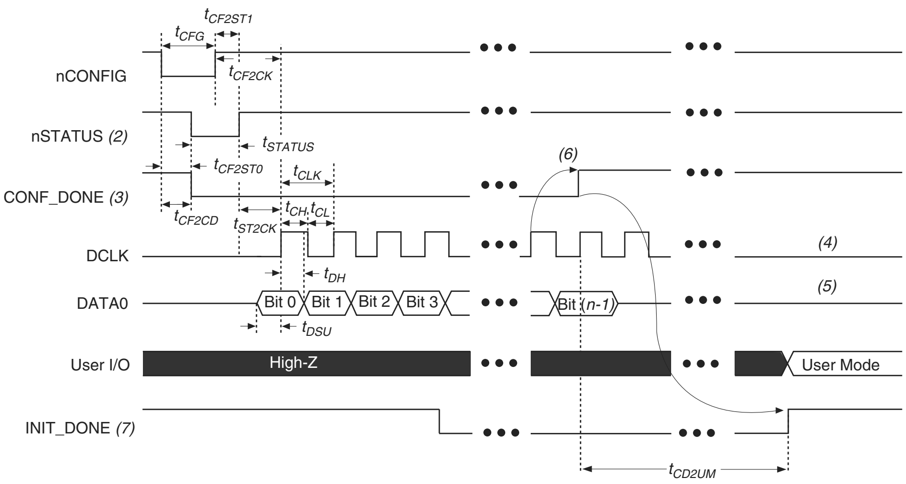
(2) t_{CF2CD}, t_{CF2ST0}, t_{CFG}, t_{STATUS}, and t_{CF2ST1} timing parameters are identical to the timing parameters for PS mode listed in Table 54 on page 63.

(3) To enable the `CLKUSR` pin as the initialization clock source and to obtain the maximum frequency specification on this pin, refer to the Initialization section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

Passive Serial Configuration Timing

Figure 15 shows the timing waveform for a passive serial (PS) configuration when using a MAX II device, MAX V device, or microprocessor as an external host.

Figure 15. PS Configuration Timing Waveform *(1)*



Notes to Figure 15:

(1) The beginning of this waveform shows the device in user mode. In user mode, `nCONFIG`, `nSTATUS`, and `CONF_DONE` are at logic high levels. When `nCONFIG` is pulled low, a reconfiguration cycle begins.

(2) After power-up, the Stratix V device holds `nSTATUS` low for the time of the POR delay.

(3) After power-up, before and during configuration, `CONF_DONE` is low.

(4) Do not leave `DCLK` floating after configuration. You can drive it high or low, whichever is more convenient.

(5) `DATA0` is available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings in the **Device and Pins Option**.

(6) To ensure a successful configuration, send the entire configuration data to the Stratix V device. `CONF_DONE` is released high after the Stratix V device receives all the configuration data successfully. After `CONF_DONE` goes high, send two additional falling edges on `DCLK` to begin initialization and enter user mode.

(7) After the option bit to enable the `INIT_DONE` pin is configured into the device, the `INIT_DONE` goes low.

Table 60. Glossary (Part 3 of 4)

Letter	Subject	Definitions
S	**SW (sampling window)**	Timing Diagram—the period of time during which the data must be valid in order to capture it correctly. The setup and hold times determine the ideal strobe position within the sampling window, as shown: 	Single-ended voltage referenced I/O standard	The JEDEC standard for **SSTL** and **HSTL** I/O defines both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state. The new logic state is then maintained as long as the input stays beyond the DC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing: *Single-Ended Voltage Referenced I/O Standard* T	t_C	High-speed receiver and transmitter input and output clock period.
	TCCS (channel-to-channel-skew)	The timing difference between the fastest and slowest output edges, including t_{CO} variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the *Timing Diagram* figure under **SW** in this table).
	t_{DUTY}	High-speed I/O block—Duty cycle on the high-speed transmitter output clock. **Timing Unit Interval (TUI)** The timing budget allowed for skew, propagation delays, and the data sampling window. (TUI = 1/(receiver input clock frequency multiplication factor) = t_C/w)
	t_{FALL}	Signal high-to-low transition time (80-20%)
	t_{INCCJ}	Cycle-to-cycle jitter tolerance on the PLL clock input.
	t_{OUTPJ_IO}	Period jitter on the general purpose I/O driven by a PLL.
	t_{OUTPJ_DC}	Period jitter on the dedicated clock output driven by a PLL.
	t_{RISE}	Signal low-to-high transition time (20-80%)
