### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	160500
Number of Logic Elements/Cells	425000
Total RAM Bits	46080000
Number of I/O	600
Number of Gates	-
Voltage - Supply	0.87V ~ 0.93V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (Tj)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FBGA (40x40)

<b>Symbol</b>	<b>Description</b>	<b>Condition</b>	<b>Min <sup>(4)</sup></b>	<b>Typ</b>	<b>Max <sup>(4)</sup></b>	<b>Unit</b>
$t_{RAMP}$	Power supply ramp time	Standard POR	200 $\mu$ s	—	100 ms	—
		Fast POR	200 $\mu$ s	—	4 ms	—

**Notes to Table 6:**

- (1)  $V_{CCPD}$  must be 2.5 V when  $V_{CCIO}$  is 2.5, 1.8, 1.5, 1.35, 1.25 or 1.2 V.  $V_{CCPD}$  must be 3.0 V when  $V_{CCIO}$  is 3.0 V.
- (2) If you do not use the design security feature in Stratix V devices, connect  $V_{CCBAT}$  to a 1.2- to 3.0-V power supply. Stratix V power-on-reset (POR) circuitry monitors  $V_{CCBAT}$ . Stratix V devices will not exit POR if  $V_{CCBAT}$  stays at logic low.
- (3) C2L and I2L can also be run at 0.90 V for legacy boards that were designed for the C2 and I2 speed grades.
- (4) The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

Table 7 lists the transceiver power supply recommended operating conditions for Stratix V GX, GS, and GT devices.

If BOTH of the following conditions are true: ■ Data rate > 10.3 Gbps. ■ DFE is used.	All	1.05			
If ANY of the following conditions are true <sup>(1)</sup> : ■ ATX PLL is used. ■ Data rate > 6.5Gbps. ■ DFE (data rate ≤ 10.3 Gbps), AEQ, or EyeQ feature is used.	All	1.0	3.0	1.5	V
If ALL of the following conditions are true: ■ ATX PLL is not used. ■ Data rate ≤ 6.5Gbps. ■ DFE, AEQ, and EyeQ are not used.	C1, C2, I2, and I3YY  C2L, C3, C4, I2L, I3, I3L, and I4	0.90  0.85	2.5  2.5		

**Notes to Table 8:**

- (1) Choose this power supply voltage requirement option if you plan to upgrade your design later with any of the listed conditions.
- (2) If the VCCR\_GXB and VCCT\_GXB supplies are set to 1.0 V or 1.05 V, they cannot be shared with the VCC core supply. If the VCCR\_GXB and VCCT\_GXB are set to either 0.90 V or 0.85 V, they can be shared with the VCC core supply.

## DC Characteristics

This section lists the supply current, I/O pin leakage current, input pin capacitance, on-chip termination tolerance, and hot socketing specifications.

### Supply Current

Supply current is the current drawn from the respective power rails used for power budgeting. Use the Excel-based Early Power Estimator (EPE) to get supply current estimates for your design because these currents vary greatly with the resources you use.

-  For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

**Notes to Table 28:**

- (1) Speed grades shown refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.
- (2) The reference clock common mode voltage is equal to the VCCR\_GXB power supply level.
- (3) The device cannot tolerate prolonged operation at this absolute maximum.
- (4) The differential eye opening specification at the receiver input pins assumes that receiver equalization is disabled. If you enable receiver equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (5) Refer to Figure 5 for the GT channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (6) Refer to Figure 6 for the GT channel DC gain curves.
- (7) CFP2 optical modules require the host interface to have the receiver data pins differentially terminated with  $100\ \Omega$ . The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (8) Specifications for this parameter are the same as for Stratix V GX and GS devices. See Table 23 for specifications.
- (9) t<sub>LTR</sub> is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (10) t<sub>LTD</sub> is time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high.
- (11) t<sub>LTD\_manual</sub> is the time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high when the CDR is functioning in the manual mode.
- (12) t<sub>LTR\_LTD\_manual</sub> is the time the receiver CDR must be kept in lock to reference (LTR) mode after the rx\_is\_lockedtoref signal goes high when the CDR is functioning in the manual mode.
- (13) t<sub>PLL\_powerdown</sub> is the PLL powerdown minimum pulse width.
- (14) t<sub>PLL\_lock</sub> is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (15) To calculate the REFCLK rms phase jitter requirement for PCIe at reference clock frequencies other than 100 MHz, use the following formula:  

$$\text{REFCLK rms phase jitter at } f(\text{MHz}) = \text{REFCLK rms phase jitter at } 100 \text{ MHz} \times 100/f.$$
- (16) The maximum peak to peak differential input voltage V<sub>ID</sub> after device configuration is equal to  $4 \times (\text{absolute } V_{\text{MAX}} \text{ for receiver pin} - V_{\text{ICM}})$ .
- (17) For ES devices, RREF is  $2000\ \Omega \pm 1\%$ .
- (18) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at  $f(\text{MHz}) = \text{REFCLK phase noise at } 622 \text{ MHz} + 20 \times \log(f/622)$ .
- (19) SFP+/ optical modules require the host interface to have RD+/- differentially terminated with  $100\ \Omega$ . The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (20) Refer to Figure 4.
- (21) For oversampling design to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (22) This supply follows VCCR\_GXB for both GX and GT channels.
- (23) When you use fPLL as a TXPLL of the transceiver.

	01010101	8	32	640 data transitions

**Notes to Table 37:**

- (1) The DPA lock time is for one channel.
- (2) One data transition is defined as a 0-to-1 or 1-to-0 transition.
- (3) The DPA lock time stated in this table applies to both commercial and industrial grade.
- (4) This is the number of repetitions for the stated training pattern to achieve the 256 data transitions.

Figure 8 shows the LVDS soft-clock data recovery (CDR)/DPA sinusoidal jitter tolerance specification for a data rate  $\geq 1.25$  Gbps. Table 38 lists the LVDS soft-CDR/DPA sinusoidal jitter tolerance specification for a data rate  $\geq 1.25$  Gbps.

## DLL Range, DQS Logic Block, and Memory Output Clock Jitter Specifications

Table 39 lists the DLL range specification for Stratix V devices. The DLL is always in 8-tap mode in Stratix V devices.

**Table 39. DLL Range Specifications for Stratix V Devices (1)**

C1	C2, C2L, I2, I2L	C3, I3, I3L, I3YY	C4,I4	Unit
300-933	300-933	300-890	300-890	MHz

### Note to Table 39:

- (1) Stratix V devices support memory interface frequencies lower than 300 MHz, although the reference clock that feeds the DLL must be at least 300 MHz. To support interfaces below 300 MHz, multiply the reference clock feeding the DLL to ensure the frequency is within the supported range of the DLL.

Table 40 lists the DQS phase offset delay per stage for Stratix V devices.

**Table 40. DQS Phase Offset Delay Per Setting for Stratix V Devices (1), (2) (Part 1 of 2)**

			Min	Max	Min	Max	Min	Max	Min	Max	
PHY Clock	Clock period jitter	$t_{JIT(per)}$	-25	25	-25	25	-30	30	-35	35	ps
	Cycle-to-cycle period jitter	$t_{JIT(cc)}$	-50	50	-50	50	-60	60	-70	70	ps
	Duty cycle jitter	$t_{JIT(duty)}$	-37.5	37.5	-37.5	37.5	-45	45	-56	56	ps

**Notes to Table 42:**

- (1) The clock jitter specification applies to the memory output clock pins generated using differential signal-splitter and DDIO circuits clocked by a PLL output routed on a PHY, regional, or global clock network as specified. Altera recommends using PHY clock networks whenever possible.
- (2) The clock jitter specification applies to the memory output clock pins clocked by an integer PLL.
- (3) The memory output clock jitter is applicable when an input jitter of 30 ps peak-to-peak is applied with bit error rate (BER) -12, equivalent to 14 sigma.

**OCT Calibration Block Specifications**

Table 43 lists the OCT calibration block specifications for Stratix V devices.

**Table 43. OCT Calibration Block Specifications for Stratix V Devices**

Symbol	Description	Min	Typ	Max	Unit
OCTUSRCLK	Clock required by the OCT calibration blocks	—	—	20	MHz
$T_{OCTCAL}$	Number of OCTUSRCLK clock cycles required for OCT $R_S/R_T$ calibration	—	1000	—	Cycles
$T_{OCTSHIFT}$	Number of OCTUSRCLK clock cycles required for the OCT code to shift out	—	32	—	Cycles
$T_{RS\_RT}$	Time required between the <code>dyn_term_ctrl</code> and <code>oe</code> signal transitions in a bidirectional I/O buffer to dynamically switch between OCT $R_S$ and $R_T$ (Figure 10)	—	2.5	—	ns

Figure 10 shows the timing diagram for the `oe` and `dyn_term_ctrl` signals.

**Figure 10. Timing Diagram for oe and dyn\_term\_ctrl Signals**

**Table 49. DCLK-to-DATA[] Ratio <sup>(1)</sup> (Part 2 of 2)**

<b>Configuration Scheme</b>	<b>Decompression</b>	<b>Design Security</b>	<b>DCLK-to-DATA[] Ratio</b>
FPP ×32	Disabled	Disabled	1
	Disabled	Enabled	4
	Enabled	Disabled	8
	Enabled	Enabled	8

**Note to Table 49:**

- (1) Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is r times the data rate in bytes per second (Bps), or words per second (Wps). For example, in FPP ×16 when the DCLK-to-DATA[] ratio is 2, the DCLK frequency must be 2 times the data rate in Wps. Stratix V devices use the additional clock cycles to decrypt and decompress the configuration data.

 If the DCLK-to-DATA[] ratio is greater than 1, at the end of configuration, you can only stop the DCLK (DCLK-to-DATA[] ratio – 1) clock cycles after the last data is latched into the Stratix V device.

Figure 11 shows the configuration interface connections between the Stratix V device and a MAX II or MAX V device for single device configuration.

**Figure 11. Single Device FPP Configuration Using an External Host****Notes to Figure 11:**

- (1) Connect the resistor to a supply that provides an acceptable input signal for the Stratix V device.  $V_{CCPGM}$  must be high enough to meet the  $V_{IH}$  specification of the I/O on the device and the external host. Altera recommends powering up all configuration system I/Os with  $V_{CCPGM}$ .
- (2) You can leave the nCEO pin unconnected or use it as a user I/O pin when it does not feed another device's nCE pin.
- (3) The MSEL pin settings vary for different data width, configuration voltage standards, and POR delay. To connect MSEL, refer to the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.
- (4) If you use FPP ×8, use DATA [7..0]. If you use FPP ×16, use DATA [15..0].

P	PLL Specifications	<b>Diagram of PLL Specifications (1)</b>   <p>The diagram shows the internal architecture of a PLL. It includes:  - Input CLK and Core Clock feeds into a 4:1 multiplexer.  - The output of the multiplexer goes to a switcher.  - The switcher connects to an N-frequency multiplier (f<sub>IN</sub> to f<sub>INPFD</sub>).  - The f<sub>INPFD</sub> signal goes to a Phase Frequency Detector (PFD).  - The PFD is connected to a Charge Pump (CP) and a Loop Filter (LF).  - The LF feeds into a Voltage Control Oscillator (VCO).  - The VCO output goes to a Delta Sigma Modulator.  - The modulator provides feedback to the PFD.  - The VCO also drives a counter (C0, C17).  - The counter output is GCLK.  - The GCLK feeds back to the switcher.  - The VCO output also drives an RCLK.  - The final output is f<sub>OUT_EXT</sub>.</p> <p><b>Note:</b>  (1) Core Clock can only be fed by dedicated clock input pins or PLL outputs.</p>
