Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Calibration accuracy for the calibrated series and parallel OCTs are applicable at the moment of calibration. When voltage and temperature conditions change after calibration, the tolerance may change.

OCT calibration is automatically performed at power-up for OCT-enabled I/Os. Table 13 lists the OCT variation with temperature and voltage after power-up calibration. Use Table 13 to determine the OCT variation after power-up calibration and Equation 1 to determine the OCT variation without recalibration.

Equation 1. OCT Variation Without Recalibration for Stratix V Devices *(1), (2), (3), (4), (5), (6)*

$$R_{OCT} = R_{SCAL}\left(1 + \langle\frac{dR}{dT} \times \Delta T\rangle \pm \langle\frac{dR}{dV} \times \Delta V\rangle\right)$$

Notes to Equation 1:

(1) The R_{OCT} value shows the range of OCT resistance with the variation of temperature and V_{CCIO}.
(2) R_{SCAL} is the OCT resistance value at power-up.
(3) ΔT is the variation of temperature with respect to the temperature at power-up.
(4) ΔV is the variation of voltage with respect to the V_{CCIO} at power-up.
(5) dR/dT is the percentage change of R_{SCAL} with temperature.
(6) dR/dV is the percentage change of R_{SCAL} with voltage.

Table 13 lists the on-chip termination variation after power-up calibration.

You typically use the interactive Excel-based Early Power Estimator before designing the FPGA to get a magnitude estimate of the device power. The Quartus II PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yields very accurate power estimates.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

Switching Characteristics

This section provides performance characteristics of the Stratix V core and periphery blocks.

These characteristics can be designated as Preliminary or Final.

- Preliminary characteristics are created using simulation results, process data, and other known parameters. The title of these tables show the designation as "Preliminary."
- Final numbers are based on actual silicon characterization and testing. The numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. There are no designations on finalized tables.

(1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.

(2) This specification is limited by the lower of the two: I/O f_{MAX} or f_{OUT} of the PLL.

(3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source < 120 ps.

(4) f_{REF} is fIN/N when N = 1.

(5) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.99999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 44 on page 52.

(6) The cascaded PLL specification is only applicable with the following condition:
a. Upstream PLL: 0.59Mhz ≤ Upstream PLL BW < 1 MHz
b. Downstream PLL: Downstream PLL BW > 2 MHz

(7) High bandwidth PLL settings are not supported in external feedback mode.

(8) The external memory interface clock output jitter specifications use a different measurement method, which is available in Table 42 on page 50.

(9) The VCO frequency reported by the Quartus II software in the PLL Usage Summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the f_{VCO} specification.

(10) This specification only covers fractional PLL for low bandwidth. The f_{VCO} for fractional value range 0.05 - 0.95 must be ≥ 1000 MHz, while f_{VCO} for fractional value range 0.20 - 0.80 must be ≥ 1200 MHz.

(11) This specification only covered fractional PLL for low bandwidth. The f_{VCO} for fractional value range 0.05-0.95 must be ≥ 1000 MHz.

(12) This specification only covered fractional PLL for low bandwidth. The f_{VCO} for fractional value range 0.20-0.80 must be ≥ 1200 MHz.

DLL Range, DQS Logic Block, and Memory Output Clock Jitter Specifications

Table 39 lists the DLL range specification for Stratix V devices. The DLL is always in 8-tap mode in Stratix V devices.

Table 39. DLL Range Specifications for Stratix V Devices (1)

C1	C2, C2L, I2, I2L	C3, I3, I3L, I3YY	C4,I4	Unit
300-933	300-933	300-890	300-890	MHz

Note to Table 39:

(1) Stratix V devices support memory interface frequencies lower than 300 MHz, although the reference clock that feeds the DLL must be at least 300 MHz. To support interfaces below 300 MHz, multiply the reference clock feeding the DLL to ensure the frequency is within the supported range of the DLL.

Table 40 lists the DQS phase offset delay per stage for Stratix V devices.

Notes to Table 42:

(1) The clock jitter specification applies to the memory output clock pins generated using differential signal-splitter and DDIO circuits clocked by a PLL output routed on a PHY, regional, or global clock network as specified. Altera recommends using PHY clock networks whenever possible.

(2) The clock jitter specification applies to the memory output clock pins clocked by an integer PLL.

(3) The memory output clock jitter is applicable when an input jitter of 30 ps peak-to-peak is applied with bit error rate (BER) -12, equivalent to 14 sigma.

OCT Calibration Block Specifications

Table 43 lists the OCT calibration block specifications for Stratix V devices.

Table 43. OCT Calibration Block Specifications for Stratix V Devices

Symbol	Description	Min	Typ	Max	Unit
OCTUSRCLK	Clock required by the OCT calibration blocks	—	—	20	MHz
T_{OCTCAL}	Number of OCTUSRCLK clock cycles required for OCT R_S/R_T calibration	—	1000	—	Cycles

Figure 10 shows the timing diagram for the `oe` and `dyn_term_ctrl` signals.

Table 49. DCLK-to-DATA[] Ratio (1) (Part 2 of 2)

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×32	Disabled	Disabled	1
	Disabled	Enabled	4
	Enabled	Disabled	8
	Enabled	Enabled	8

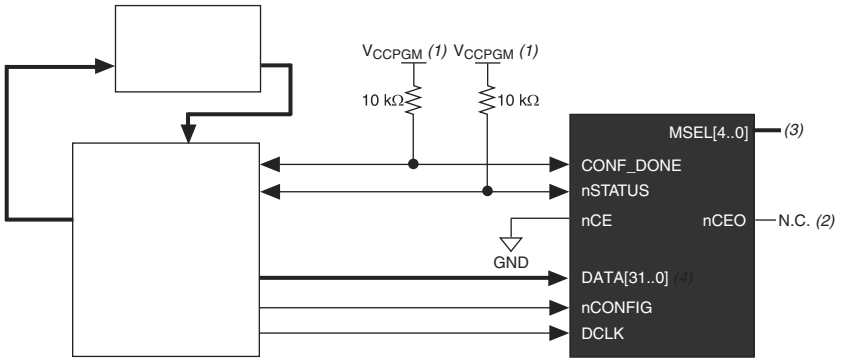
Note to Table 49:

(1) Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is r times the data rate in bytes per second (Bps), or words per second (Wps). For example, in FPP ×16 when the DCLK-to-DATA[] ratio is 2, the DCLK frequency must be 2 times the data rate in Wps. Stratix V devices use the additional clock cycles to decrypt and decompress the configuration data.

If the DCLK-to-DATA[] ratio is greater than 1, at the end of configuration, you can only stop the DCLK (DCLK-to-DATA[] ratio – 1) clock cycles after the last data is latched into the Stratix V device.

Figure 11 shows the configuration interface connections between the Stratix V device and a MAX II or MAX V device for single device configuration.

Figure 11. Single Device FPP Configuration Using an External Host



Notes to Figure 11:

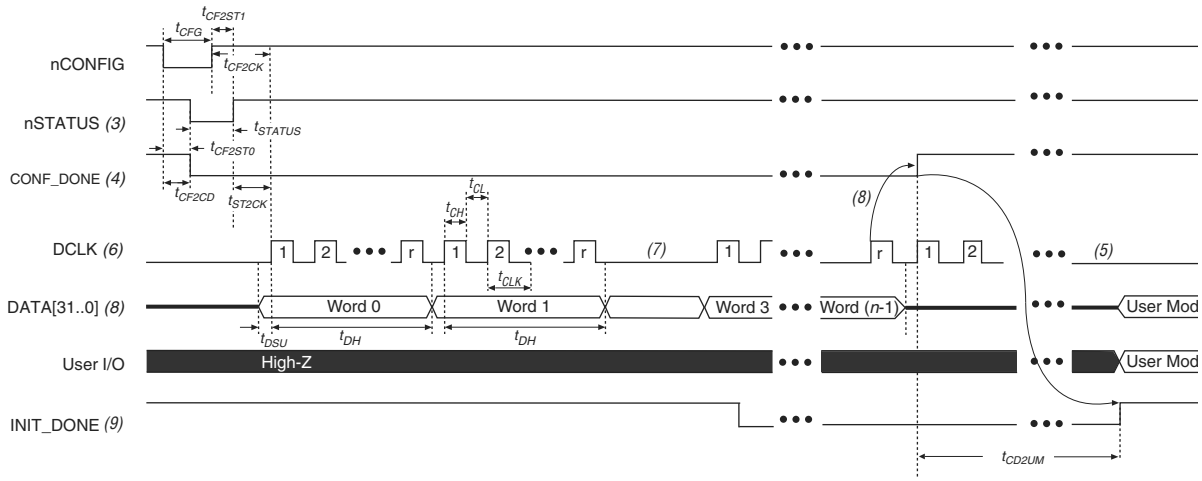
(1) Connect the resistor to a supply that provides an acceptable input signal for the Stratix V device. V_{CCPGM} must be high enough to meet the V_{IH} specification of the I/O on the device and the external host. Altera recommends powering up all configuration system I/Os with V_{CCPGM}.

(2) You can leave the nCEO pin unconnected or use it as a user I/O pin when it does not feed another device's nCE pin.

(3) The MSEL pin settings vary for different data width, configuration voltage standards, and POR delay. To connect MSEL, refer to the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

(4) If you use FPP ×8, use DATA[7..0]. If you use FPP ×16, use DATA[15..0].

Figure 13. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is >1 *(1), (2)*



Notes to Figure 13:

(1) Use this timing waveform and parameters when the DCLK-to-DATA[] ratio is >1. To find out the DCLK-to-DATA[] ratio for your system, refer to Table 49 on page 55.

(2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.

(3) After power-up, the Stratix V device holds nSTATUS low for the time as specified by the POR delay.

(4) After power-up, before and during configuration, CONF_DONE is low.

(5) Do not leave DCLK floating after configuration. You can drive it high or low, whichever is more convenient.

(6) "r" denotes the DCLK-to-DATA[] ratio. For the DCLK-to-DATA[] ratio based on the decompression and the design security feature enable settings, refer to Table 49 on page 55.

(7) If needed, pause DCLK by holding it low. When DCLK restarts, the external host must provide data on the DATA[31..0] pins prior to sending the first DCLK rising edge.

(8) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF_DONE is released high after the Stratix V device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.

(9) After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.

Table 54 lists the PS configuration timing parameters for Stratix V devices.

Table 54. PS Timing Parameters for Stratix V Devices

t_{CF2ST1}	nCONFIG high to nSTATUS high	—	1,506 (2)	µs
t_{CF2CK} (5)	nCONFIG high to first rising edge on DCLK	1,506	—	µs
t_{ST2CK} (5)	nSTATUS high to first rising edge of DCLK	2	—	µs

t_{DH}	DATA[] hold time after rising edge on DCLK	0	—	ns
t_{CH}	DCLK high time	$0.45 \times 1/f_{MAX}$	—	s
t_{CL}	DCLK low time	$0.45 \times 1/f_{MAX}$	—	s
t_{CLK}	DCLK period	$1/f_{MAX}$	—	s
f_{MAX}	DCLK frequency	—	125	MHz
t_{CD2UM}	CONF_DONE high to user mode (3)	175	437	µs
t_{CD2CU}	CONF_DONE high to CLKUSR enabled	4 × maximum DCLK period	—	—
t_{CD2UMC}	CONF_DONE high to user mode with CLKUSR option on	t_{CD2CU} + (8576 × CLKUSR period) (4)	—	—

Notes to Table 54:

(1) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

(2) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.

(3) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

(4) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the "Initialization" section.

(5) If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.
