### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

**Absolute Maximum Ratings**

Absolute maximum ratings define the maximum operating conditions for Stratix V devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

Conditions other than those listed in Table 3 may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

**Table 3. Absolute Maximum Ratings for Stratix V Devices (Part 1 of 2)**

<b>Symbol</b>	<b>Description</b>	<b>Condition</b>	<b>Min <sup>(4)</sup></b>	<b>Typ</b>	<b>Max <sup>(4)</sup></b>	<b>Unit</b>
$t_{RAMP}$	Power supply ramp time	Standard POR	200 $\mu$ s	—	100 ms	—
		Fast POR	200 $\mu$ s	—	4 ms	—

**Notes to Table 6:**

- (1)  $V_{CCPD}$  must be 2.5 V when  $V_{CCIO}$  is 2.5, 1.8, 1.5, 1.35, 1.25 or 1.2 V.  $V_{CCPD}$  must be 3.0 V when  $V_{CCIO}$  is 3.0 V.
- (2) If you do not use the design security feature in Stratix V devices, connect  $V_{CCBAT}$  to a 1.2- to 3.0-V power supply. Stratix V power-on-reset (POR) circuitry monitors  $V_{CCBAT}$ . Stratix V devices will not exit POR if  $V_{CCBAT}$  stays at logic low.
- (3) C2L and I2L can also be run at 0.90 V for legacy boards that were designed for the C2 and I2 speed grades.
- (4) The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

Table 7 lists the transceiver power supply recommended operating conditions for Stratix V GX, GS, and GT devices.

## Power Consumption

Altera offers two ways to estimate power consumption for a design—the Excel-based Early Power Estimator and the Quartus® II PowerPlay Power Analyzer feature.

**Notes to Table 28:**

- (1) Speed grades shown refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.
- (2) The reference clock common mode voltage is equal to the VCCR\_GXB power supply level.
- (3) The device cannot tolerate prolonged operation at this absolute maximum.
- (4) The differential eye opening specification at the receiver input pins assumes that receiver equalization is disabled. If you enable receiver equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (5) Refer to Figure 5 for the GT channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (6) Refer to Figure 6 for the GT channel DC gain curves.
- (7) CFP2 optical modules require the host interface to have the receiver data pins differentially terminated with  $100\ \Omega$ . The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (8) Specifications for this parameter are the same as for Stratix V GX and GS devices. See Table 23 for specifications.
- (9) t<sub>LTR</sub> is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (10) t<sub>LTD</sub> is time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high.
- (11) t<sub>LTD\_manual</sub> is the time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high when the CDR is functioning in the manual mode.
- (12) t<sub>LTR\_LTD\_manual</sub> is the time the receiver CDR must be kept in lock to reference (LTR) mode after the rx\_is\_lockedtoref signal goes high when the CDR is functioning in the manual mode.
- (13) t<sub>PLL\_powerdown</sub> is the PLL powerdown minimum pulse width.
- (14) t<sub>PLL\_lock</sub> is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (15) To calculate the REFCLK rms phase jitter requirement for PCIe at reference clock frequencies other than 100 MHz, use the following formula:  

$$\text{REFCLK rms phase jitter at } f(\text{MHz}) = \text{REFCLK rms phase jitter at } 100 \text{ MHz} \times 100/f.$$
- (16) The maximum peak to peak differential input voltage V<sub>ID</sub> after device configuration is equal to  $4 \times (\text{absolute } V_{\text{MAX}} \text{ for receiver pin} - V_{\text{ICM}})$ .
- (17) For ES devices, RREF is  $2000\ \Omega \pm 1\%$ .
- (18) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at  $f(\text{MHz}) = \text{REFCLK phase noise at } 622 \text{ MHz} + 20 \times \log(f/622)$ .
- (19) SFP+/ optical modules require the host interface to have RD+/- differentially terminated with  $100\ \Omega$ . The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (20) Refer to Figure 4.
- (21) For oversampling design to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (22) This supply follows VCCR\_GXB for both GX and GT channels.
- (23) When you use fPLL as a TXPLL of the transceiver.

		50	ps
		75	ps

**Note to Table 59:**

- (1) You can set the programmable output buffer delay in the Quartus II software by setting the **Output Buffer Delay Control** assignment to either positive, negative, or both edges, with the specific values stated here (in ps) for the **Output Buffer Delay** assignment.
