Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Absolute Maximum Ratings

Absolute maximum ratings define the maximum operating conditions for Stratix V devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

Conditions other than those listed in Table 3 may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

Table 3. Absolute Maximum Ratings for Stratix V Devices (Part 1 of 2)

Table 5 lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% of the duty cycle. For example, a signal that overshoots to 3.95 V can be at 3.95 V for only ~21% over the lifetime of the device; for a device lifetime of 10 years, the overshoot duration amounts to ~2 years.

t_{RAMP}	Power supply ramp time	Standard POR	200 μs	—	100 ms	—

Notes to Table 6:

- (1) V_{CCPD} must be 2.5 V when V_{CCIO} is 2.5, 1.8, 1.5, 1.35, 1.25 or 1.2 V. V_{CCPD} must be 3.0 V when V_{CCIO} is 3.0 V.
- (2) If you do not use the design security feature in Stratix V devices, connect V_{CCBAT} to a 1.2- to 3.0-V power supply. Stratix V power-on-reset (POR) circuitry monitors V_{CCBAT} . Stratix V devices will not exit POR if V_{CCBAT} stays at logic low.
- (3) C2L and I2L can also be run at 0.90 V for legacy boards that were designed for the C2 and I2 speed grades.
- (4) The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

Table 12. OCT Without Calibration Resistance Tolerance Specifications for Stratix V Devices (Part 2 of 2)

Symbol	Description	Conditions	Resistance Tolerance				Unit
			C1	C2, I2	C3, I3, I3YY	C4, I4	
50-Ω R _S	Internal series termination without calibration (50-Ω setting)	V _{CCIO} = 1.8 and 1.5 V	±30	±30	±40	±40	%
50-Ω R _S	Internal series termination without calibration (50-Ω setting)	V _{CCIO} = 1.2 V	±35	±35	±50	±50	%
100-Ω R _D	Internal differential termination (100-Ω setting)	V _{CCPD} = 2.5 V	±25	±25	±25	±25	%

Calibration accuracy for the calibrated series and parallel OCTs are applicable at the moment of calibration. When voltage and temperature conditions change after calibration, the tolerance may change.

OCT calibration is automatically performed at power-up for OCT-enabled I/Os. Table 13 lists the OCT variation with temperature and voltage after power-up calibration. Use Table 13 to determine the OCT variation after power-up calibration and Equation 1 to determine the OCT variation without recalibration.

Equation 1. OCT Variation Without Recalibration for Stratix V Devices ^{(1), (2), (3), (4), (5), (6)}

$$R_{OCT} = R_{SCAL} \left(1 + \left\langle \frac{dR}{dT} \times \Delta T \right\rangle \pm \left\langle \frac{dR}{dV} \times \Delta V \right\rangle \right)$$

Notes to Equation 1:

- (1) The R_{OCT} value shows the range of OCT resistance with the variation of temperature and V_{CCIO}.
- (2) R_{SCAL} is the OCT resistance value at power-up.
- (3) ΔT is the variation of temperature with respect to the temperature at power-up.
- (4) ΔV is the variation of voltage with respect to the V_{CCIO} at power-up.
- (5) dR/dT is the percentage change of R_{SCAL} with temperature.
- (6) dR/dV is the percentage change of R_{SCAL} with voltage.

Table 13 lists the on-chip termination variation after power-up calibration.

		1.35 ±5%	25	kΩ
		1.25 ±5%	25	kΩ
		1.2 ±5%	25	kΩ

Notes to Table 16:

- (1) All I/O pins have an option to enable the weak pull-up resistor except the configuration, test, and JTAG pins.
- (2) The internal weak pull-down feature is only available for the JTAG TCK pin. The typical value for this internal weak pull-down resistor is approximately 25 kΩ.
- (3) The pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.
- (4) These specifications are valid with a ±10% tolerance to cover changes over PVT.

Table 17 through Table 22 list the input voltage (V_{IH} and V_{IL}), output voltage (V_{OH} and V_{OL}), and current drive characteristics (I_{OH} and I_{OL}) for various I/O standards supported by Stratix V devices. These tables also show the Stratix V device family I/O standard specifications. The V_{OL} and V_{OH} values are valid at the corresponding I_{OH} and I_{OL}, respectively.

For an explanation of the terms used in Table 17 through Table 22, refer to “Glossary” on page 65. For tolerance calculations across all SSTL and HSTL I/O standards, refer to Altera knowledge base solution rd07262012_486.

-  You typically use the interactive Excel-based Early Power Estimator before designing the FPGA to get a magnitude estimate of the device power. The Quartus II PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yields very accurate power estimates.
-  For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

Notes to Table 33:

- (1) To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL set to **50%** output duty cycle. Use the Quartus II software to report timing for this and other memory block clocking schemes.
- (2) When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in F_{MAX} .
- (3) The F_{MAX} specification is only achievable with Fitter options, **MLAB Implementation In 16-Bit Deep Mode** enabled.

Periphery Performance

This section describes periphery performance, including high-speed I/O and external memory interface.

I/O performance supports several system interfaces, such as the **LVDS** high-speed I/O interface, external memory interface, and the **PCI/PCI-X** bus interface.

General-purpose I/O standards such as 3.3-, 2.5-, 1.8-, and 1.5-**LVTTL/LVCMOS** are capable of a typical 167 MHz and 1.2-**LVCMOS** at 100 MHz interfacing frequency with a 10 pF load.

The actual achievable frequency depends on design- and system-specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

Notes to Table 37:

- (1) The DPA lock time is for one channel.
- (2) One data transition is defined as a 0-to-1 or 1-to-0 transition.
- (3) The DPA lock time stated in this table applies to both commercial and industrial grade.
- (4) This is the number of repetitions for the stated training pattern to achieve the 256 data transitions.

Figure 8 shows the LVDS soft-clock data recovery (CDR)/DPA sinusoidal jitter tolerance specification for a data rate ≥ 1.25 Gbps. Table 38 lists the LVDS soft-CDR/DPA sinusoidal jitter tolerance specification for a data rate ≥ 1.25 Gbps.

FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is 1.

Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 ^{(1), (2)}

Notes to Figure 12:

- (1) Use this timing waveform when the DCLK-to-DATA [] ratio is 1.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (4) After power-up, before and during configuration, CONF_DONE is low.
- (5) Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
- (6) For FPP x16, use DATA [15..0]. For FPP x8, use DATA [7..0]. DATA [31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.
- (7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF_DONE is released high when the Stratix V device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (8) After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.

Active Serial Configuration Timing

Table 52 lists the DCLK frequency specification in the AS configuration scheme.

Table 52. DCLK Frequency Specification in the AS Configuration Scheme ^{(1), (2)}

Minimum	Typical	Maximum	Unit
5.3	7.9	12.5	MHz
10.6	15.7	25.0	MHz
21.3	31.4	50.0	MHz
42.6	62.9	100.0	MHz

Notes to Table 52:

- (1) This applies to the DCLK frequency specification when using the internal oscillator as the configuration clock source.
- (2) The AS multi-device configuration scheme does not support DCLK frequency of 100 MHz.

Figure 14 shows the single-device configuration setup for an AS ×1 mode.

Figure 14. AS Configuration Timing

Notes to Figure 14:

- (1) If you are using AS ×4 mode, this signal represents the AS_DATA [3 : 0] and EPCQ sends in 4-bits of data for each DCLK cycle.
- (2) The initialization clock can be from internal oscillator or CLKUSR pin.
- (3) After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.

Table 53 lists the timing parameters for AS ×1 and AS ×4 configurations in Stratix V devices.

Table 53. AS Timing Parameters for AS ×1 and AS ×4 Configurations in Stratix V Devices ^{(1), (2)} (Part 1 of 2)
