### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

$t_{RAMP}$	Power supply ramp time	Standard POR	200 $\mu$ s	—	100 ms	—
		Fast POR	200 $\mu$ s	—	4 ms	—

**Notes to Table 6:**

- (1)  $V_{CCPD}$  must be 2.5 V when  $V_{CCIO}$  is 2.5, 1.8, 1.5, 1.35, 1.25 or 1.2 V.  $V_{CCPD}$  must be 3.0 V when  $V_{CCIO}$  is 3.0 V.
- (2) If you do not use the design security feature in Stratix V devices, connect  $V_{CCBAT}$  to a 1.2- to 3.0-V power supply. Stratix V power-on-reset (POR) circuitry monitors  $V_{CCBAT}$ . Stratix V devices will not exit POR if  $V_{CCBAT}$  stays at logic low.
- (3) C2L and I2L can also be run at 0.90 V for legacy boards that were designed for the C2 and I2 speed grades.
- (4) The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

Table 7 lists the transceiver power supply recommended operating conditions for Stratix V GX, GS, and GT devices.

## Switching Characteristics

This section provides performance characteristics of the Stratix V core and periphery blocks.

These characteristics can be designated as Preliminary or Final.

- Preliminary characteristics are created using simulation results, process data, and other known parameters. The title of these tables show the designation as "Preliminary."
- Final numbers are based on actual silicon characterization and testing. The numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. There are no designations on finalized tables.

## Transceiver Performance Specifications

This section describes transceiver performance specifications.

Symbol	Parameter	Min	Typ	Max	Unit
$f_{RES}$	Resolution of VCO frequency ( $f_{INPFD} = 100$ MHz)	390625	5.96	0.023	Hz

**Notes to Table 31:**

- (1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.
- (2) This specification is limited by the lower of the two: I/O  $f_{MAX}$  or  $f_{OUT}$  of the PLL.
- (3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source < 120 ps.
- (4)  $f_{REF}$  is  $f_{IN}/N$  when  $N = 1$ .
- (5) Peak-to-peak jitter with a probability level of  $10^{-12}$  (14 sigma, 99.9999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 44 on page 52.
- (6) The cascaded PLL specification is only applicable with the following condition:
  - a. Upstream PLL:  $0.59\text{MHz} \leq \text{Upstream PLL BW} < 1$  MHz
  - b. Downstream PLL: Downstream PLL BW > 2 MHz
- (7) High bandwidth PLL settings are not supported in external feedback mode.
- (8) The external memory interface clock output jitter specifications use a different measurement method, which is available in Table 42 on page 50.
- (9) The VCO frequency reported by the Quartus II software in the PLL Usage Summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the  $f_{VCO}$  specification.
- (10) This specification only covers fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.05 - 0.95 must be  $\geq 1000$  MHz, while  $f_{VCO}$  for fractional value range 0.20 - 0.80 must be  $\geq 1200$  MHz.
- (11) This specification only covered fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.05-0.95 must be  $\geq 1000$  MHz.
- (12) This specification only covered fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.20-0.80 must be  $\geq 1200$  MHz.

## DLL Range, DQS Logic Block, and Memory Output Clock Jitter Specifications

Table 39 lists the DLL range specification for Stratix V devices. The DLL is always in 8-tap mode in Stratix V devices.

300-933	300-933	300-890	300-890	MHz

### Note to Table 39:

- (1) Stratix V devices support memory interface frequencies lower than 300 MHz, although the reference clock that feeds the DLL must be at least 300 MHz. To support interfaces below 300 MHz, multiply the reference clock feeding the DLL to ensure the frequency is within the supported range of the DLL.

**Notes to Table 42:**

- (1) The clock jitter specification applies to the memory output clock pins generated using differential signal-splitter and DDIO circuits clocked by a PLL output routed on a PHY, regional, or global clock network as specified. Altera recommends using PHY clock networks whenever possible.
- (2) The clock jitter specification applies to the memory output clock pins clocked by an integer PLL.
- (3) The memory output clock jitter is applicable when an input jitter of 30 ps peak-to-peak is applied with bit error rate (BER) -12, equivalent to 14 sigma.

**OCT Calibration Block Specifications**

**Notes to Table 47:**

- (1) Stratix V E devices do not have PCI Express® (PCIe®) hard IP. Stratix V E devices do not support the CvP configuration scheme.
- (2) 36-transceiver devices.
- (3) 24-transceiver devices.
- (4) File size for the periphery image.
- (5) The IOCSR .rbf size is specifically for the CvP feature.

Use the data in Table 47 to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal (.hex) or tabular text file (.ttf) format, have different file sizes. For the different types of configuration file and file sizes, refer to the Quartus II software. However, for a specific version of the Quartus II software, any design targeted for the same device has the same uncompressed configuration file size. If you are using compression, the file size can vary after each compilation because the compression ratio depends on your design.

- For more information about setting device configuration options, refer to *Configuration, Design Security, and Remote System Upgrades in Stratix V Devices*. For creating configuration files, refer to the *Quartus II Help*.

## Fast Passive Parallel Configuration Timing

This section describes the fast passive parallel (FPP) configuration timing parameters for Stratix V devices.

### DCLK-to-DATA[] Ratio for FPP Configuration

FPP configuration requires a different DCLK-to-DATA [] ratio when you enable the design security, decompression, or both features. Table 49 lists the DCLK-to-DATA [] ratio for each combination.

**Table 49. DCLK-to-DATA[] Ratio <sup>(1)</sup> (Part 1 of 2)**

Table 51 lists the timing parameters for Stratix V devices for FPP configuration when the DCLK-to-DATA [ ] ratio is more than 1.

**Notes to Table 51:**

- (1) Use these timing parameters when you use the decompression and design security features.
- (2) You can obtain this value if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (3) The minimum and maximum numbers apply only if you use the internal oscillator as the clock source for initializing the device.
- (4) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.
- (5) N is the DCLK-to-DATA ratio and  $f_{DCLK}$  is the DCLK frequency the system is operating.
- (6) If nSTATUS is monitored, follow the  $t_{ST2CK}$  specification. If nSTATUS is not monitored, follow the  $t_{CF2CK}$  specification.

$t_{CD2CU}$	CONF_DONE high to CLKUSR enabled	4 × maximum DCLK period	—	—
$t_{CD2UMC}$	CONF_DONE high to user mode with CLKUSR option on	$t_{CD2CU} + (8576 \times$ CLKUSR period)	—	—

**Notes to Table 53:**

- (1) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.
- (2)  $t_{CF2CD}$ ,  $t_{CF2STO}$ ,  $t_{CFG}$ ,  $t_{STATUS}$ , and  $t_{CF2ST1}$  timing parameters are identical to the timing parameters for PS mode listed in Table 54 on page 63.
- (3) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on this pin, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.

## Passive Serial Configuration Timing

Figure 15 shows the timing waveform for a passive serial (PS) configuration when using a MAX II device, MAX V device, or microprocessor as an external host.

**Figure 15. PS Configuration Timing Waveform<sup>(1)</sup>****Notes to Figure 15:**

- (1) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF\_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (2) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (3) After power-up, before and during configuration, CONF\_DONE is low.
- (4) Do not leave DCLK floating after configuration. You can drive it high or low, whichever is more convenient.
- (5) DATA0 is available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings in the **Device and Pins Option**.
- (6) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF\_DONE is released high after the Stratix V device receives all the configuration data successfully. After CONF\_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (7) After the option bit to enable the INIT\_DONE pin is configured into the device, the INIT\_DONE goes low.

Table 54 lists the PS configuration timing parameters for Stratix V devices.

**Table 54. PS Timing Parameters for Stratix V Devices**

Symbol	Parameter	Minimum	Maximum	Units
$t_{CF2CD}$	nCONFIG low to CONF_DONE low	—	600	ns
$t_{CF2ST0}$	nCONFIG low to nSTATUS low	—	600	ns
$t_{CFG}$	nCONFIG low pulse width	2	—	μs
$t_{STATUS}$	nSTATUS low pulse width	268	1,506 <sup>(1)</sup>	μs
$t_{CF2ST1}$	nCONFIG high to nSTATUS high	—	1,506 <sup>(2)</sup>	μs
$t_{CF2CK}^{(5)}$	nCONFIG high to first rising edge on DCLK	1,506	—	μs
$t_{ST2CK}^{(5)}$	nSTATUS high to first rising edge of DCLK	2	—	μs
$t_{DSU}$	DATA [] setup time before rising edge on DCLK	5.5	—	ns
$t_{DH}$	DATA [] hold time after rising edge on DCLK	0	—	ns
$t_{CH}$	DCLK high time	$0.45 \times 1/f_{MAX}$	—	s
$t_{CL}$	DCLK low time	$0.45 \times 1/f_{MAX}$	—	s
$t_{CLK}$	DCLK period	$1/f_{MAX}$	—	s
$f_{MAX}$	DCLK frequency	—	125	MHz
$t_{CD2UM}$	CONF_DONE high to user mode <sup>(3)</sup>	175	437	μs
$t_{CD2CU}$	CONF_DONE high to CLKUSR enabled	4 × maximum DCLK period	—	—
$t_{CD2UMC}$	CONF_DONE high to user mode with CLKUSR option on	$t_{CD2CU} + (8576 \times \text{CLKUSR period})^{(4)}$	—	—

**Notes to Table 54:**

- (1) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (2) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.
- (3) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.
- (4) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the “Initialization” section.
- (5) If nSTATUS is monitored, follow the  $t_{ST2CK}$  specification. If nSTATUS is not monitored, follow the  $t_{CF2CK}$  specification.

## Initialization

Table 55 lists the initialization clock source option, the applicable configuration schemes, and the maximum frequency.

**Table 55. Initialization Clock Source Option and the Maximum Frequency**

Initialization Clock Source	Configuration Schemes	Maximum Frequency	Minimum Number of Clock Cycles <sup>(1)</sup>
Internal Oscillator	AS, PS, FPP	12.5 MHz	8576
CLKUSR	AS, PS, FPP <sup>(2)</sup>	125 MHz	
DCLK	PS, FPP	125 MHz	

**Notes to Table 55:**

- (1) The minimum number of clock cycles required for device initialization.
- (2) To enable CLKUSR as the initialization clock source, turn on the **Enable user-supplied start-up clock (CLKUSR)** option in the Quartus II software from the **General** panel of the **Device and Pin Options** dialog box.
