### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Maximum Allowed Overshoot and Undershoot Voltage

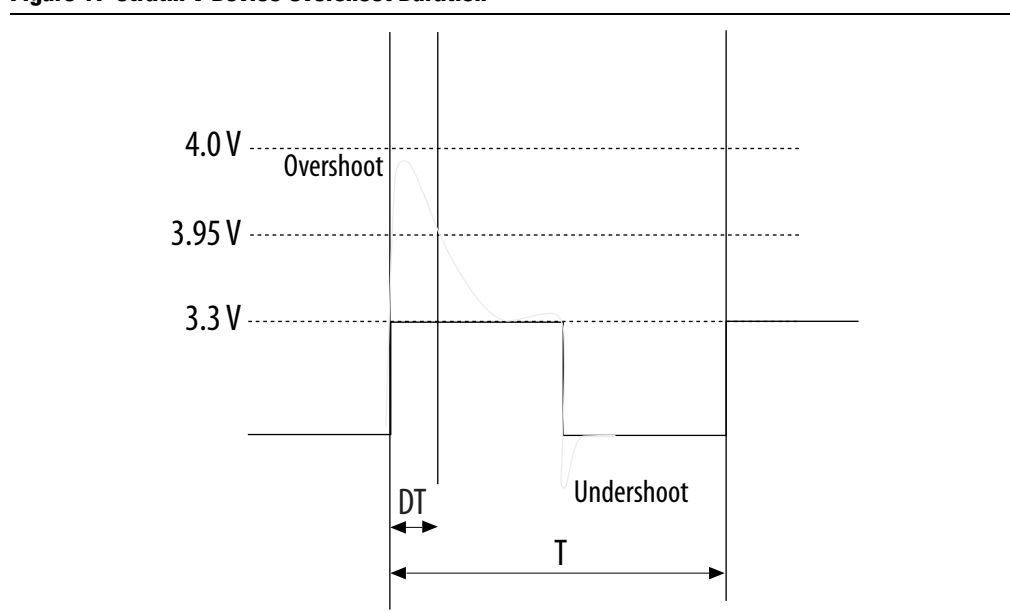

During transitions, input signals may overshoot to the voltage shown in Table 5 and undershoot to −2.0 V for input currents less than 100 mA and periods shorter than 20 ns.

Table 5 lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% of the duty cycle. For example, a signal that overshoots to 3.95 V can be at 3.95 V for only ~21% over the lifetime of the device; for a device lifetime of 10 years, the overshoot duration amounts to ~2 years.

**Table 5. Maximum Allowed Overshoot During Transitions**

Calibration accuracy for the calibrated series and parallel OCTs are applicable at the moment of calibration. When voltage and temperature conditions change after calibration, the tolerance may change.

OCT calibration is automatically performed at power-up for OCT-enabled I/Os. Table 13 lists the OCT variation with temperature and voltage after power-up calibration. Use Table 13 to determine the OCT variation after power-up calibration and Equation 1 to determine the OCT variation without recalibration.

**Equation 1. OCT Variation Without Recalibration for Stratix V Devices <sup>(1), (2), (3), (4), (5), (6)</sup>**

$$R_{OCT} = R_{SCAL} \left( 1 + \left\langle \frac{dR}{dT} \times \Delta T \right\rangle \pm \left\langle \frac{dR}{dV} \times \Delta V \right\rangle \right)$$

**Notes to Equation 1:**

- (1) The R<sub>OCT</sub> value shows the range of OCT resistance with the variation of temperature and V<sub>CCIO</sub>.
- (2) R<sub>SCAL</sub> is the OCT resistance value at power-up.
- (3) ΔT is the variation of temperature with respect to the temperature at power-up.
- (4) ΔV is the variation of voltage with respect to the V<sub>CCIO</sub> at power-up.
- (5) dR/dT is the percentage change of R<sub>SCAL</sub> with temperature.
- (6) dR/dV is the percentage change of R<sub>SCAL</sub> with voltage.

**Notes to Table 23:**

- (1) Speed grades shown in Table 23 refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.
- (2) The reference clock common mode voltage is equal to the  $V_{CCR\_GXB}$  power supply level.
- (3) This supply must be connected to 1.0 V if the transceiver is configured at a data rate > 6.5 Gbps, and to 1.05 V if configured at a data rate > 10.3 Gbps when DFE is used. For data rates up to 6.5 Gbps, you can connect this supply to 0.85 V.
- (4) This supply follows  $V_{CCR\_GXB}$ .
- (5) The device cannot tolerate prolonged operation at this absolute maximum.
- (6) The differential eye opening specification at the receiver input pins assumes that **Receiver Equalization** is disabled. If you enable **Receiver Equalization**, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (7) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.
- (8) The input reference clock frequency options depend on the data rate and the device speed grade.
- (9) The line data rate may be limited by PCS-FPGA interface speed grade.
- (10) Refer to Figure 1 for the GX channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (11)  $t_{LTR}$  is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (12)  $t_{LTD}$  is time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high.
- (13)  $t_{LTD\_manual}$  is the time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high when the CDR is functioning in the manual mode.
- (14)  $t_{LTR\_LTD\_manual}$  is the time the receiver CDR must be kept in lock to reference (LTR) mode after the rx\_is\_lockedtoref signal goes high when the CDR is functioning in the manual mode.
- (15)  $t_{pll\_powerdown}$  is the PLL powerdown minimum pulse width.
- (16)  $t_{pll\_lock}$  is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (17) To calculate the REFCLK rms phase jitter requirement for PCIe at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f(MHz) = REFCLK rms phase jitter at 100 MHz × 100/f.
- (18) The maximum peak to peak differential input voltage  $V_{ID}$  after device configuration is equal to  $4 \times (\text{absolute } V_{MAX} \text{ for receiver pin} - V_{ICM})$ .
- (19) For ES devices,  $R_{REF}$  is  $2000 \Omega \pm 1\%$ .
- (20) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at f(MHz) = REFCLK phase noise at 622 MHz +  $20 \times \log(f/622)$ .
- (21) SFP/+ optical modules require the host interface to have RD+/- differentially terminated with  $100 \Omega$ . The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (22) Refer to Figure 2.
- (23) For oversampling designs to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (24) I3YY devices can achieve data rates up to 10.3125 Gbps.
- (25) When you use fPLL as a TXPLL of the transceiver.
- (26) REFCLK performance requires to meet transmitter REFCLK phase noise specification.
- (27) Minimum eye opening of 85 mV is only for the unstressed input eye condition.

Table 25 shows the approximate maximum data rate using the standard PCS.

- (2) The Phase Compensation FIFO can be configured in FIFO mode or register mode. In the FIFO mode, the pointers are not fixed, and the latency can vary. In the register mode the pointers are fixed for low latency.
- (3) The maximum data rate is also constrained by the transceiver speed grade. Refer to Table 1 for the transceiver speed grade.

- (2) This specification is limited by the lower of the two: I/O  $f_{MAX}$  or  $f_{OUT}$  of the PLL.
- (3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source < 120 ps.
- (4)  $f_{REF}$  is  $f_{IN}/N$  when  $N = 1$ .
- (5) Peak-to-peak jitter with a probability level of  $10^{-12}$  (14 sigma, 99.9999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 44 on page 52.
- (6) The cascaded PLL specification is only applicable with the following condition:
  - a. Upstream PLL:  $0.59\text{MHz} \leq \text{Upstream PLL BW} < 1$  MHz
  - b. Downstream PLL: Downstream PLL BW > 2 MHz
- (7) High bandwidth PLL settings are not supported in external feedback mode.
- (8) The external memory interface clock output jitter specifications use a different measurement method, which is available in Table 42 on page 50.
- (9) The VCO frequency reported by the Quartus II software in the PLL Usage Summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the  $f_{VCO}$  specification.
- (10) This specification only covers fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.05 - 0.95 must be  $\geq 1000$  MHz, while  $f_{VCO}$  for fractional value range 0.20 - 0.80 must be  $\geq 1200$  MHz.
- (11) This specification only covered fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.05-0.95 must be  $\geq 1000$  MHz.
- (12) This specification only covered fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.20-0.80 must be  $\geq 1200$  MHz.

**Table 40. DQS Phase Offset Delay Per Setting for Stratix V Devices <sup>(1), (2)</sup> (Part 2 of 2)**

Speed Grade	Min	Max	Unit
C4,I4	8	16	ps

**Notes to Table 40:**

- (1) The typical value equals the average of the minimum and maximum values.
- (2) The delay settings are linear with a cumulative delay variation of 40 ps for all speed grades. For example, when using a –2 speed grade and applying a 10-phase offset setting to a 90° phase shift at 400 MHz, the expected average cumulative delay is  $[625 \text{ ps} + (10 \times 10 \text{ ps}) \pm 20 \text{ ps}] = 725 \text{ ps} \pm 20 \text{ ps}$ .

Table 41 lists the DQS phase shift error for Stratix V devices.

**Notes to Table 41:**

- (1) This error specification is the absolute maximum and minimum error. For example, skew on three DQS delay buffers in a –2 speed grade is  $\pm 78 \text{ ps}$  or  $\pm 39 \text{ ps}$ .

**Notes to Table 42:**

- (2) The clock jitter specification applies to the memory output clock pins clocked by an integer PLL.
- (3) The memory output clock jitter is applicable when an input jitter of 30 ps peak-to-peak is applied with bit error rate (BER) -12, equivalent to 14 sigma.

- (2) The minimum TCK clock period is 167 ns if VCCBAT is within the range 1.2V-1.5V when you perform the volatile key programming.

**Table 49. DCLK-to-DATA[] Ratio <sup>(1)</sup> (Part 2 of 2)**

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×32	Disabled	Disabled	1
	Disabled	Enabled	4
	Enabled	Disabled	8
	Enabled	Enabled	8

**Note to Table 49:**

- (1) Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is r times the data rate in bytes per second (Bps), or words per second (Wps). For example, in FPP ×16 when the DCLK-to-DATA[] ratio is 2, the DCLK frequency must be 2 times the data rate in Wps. Stratix V devices use the additional clock cycles to decrypt and decompress the configuration data.

If the DCLK-to-DATA[] ratio is greater than 1, at the end of configuration, you can only stop the DCLK (DCLK-to-DATA[] ratio – 1) clock cycles after the last data is latched into the Stratix V device.

Figure 11 shows the configuration interface connections between the Stratix V device and a MAX II or MAX V device for single device configuration.

**Figure 11. Single Device FPP Configuration Using an External Host****Notes to Figure 11:**

- (1) Connect the resistor to a supply that provides an acceptable input signal for the Stratix V device.  $V_{CCPGM}$  must be high enough to meet the  $V_{IH}$  specification of the I/O on the device and the external host. Altera recommends powering up all configuration system I/Os with  $V_{CCPGM}$ .
- (2) You can leave the nCEO pin unconnected or use it as a user I/O pin when it does not feed another device's nCE pin.
- (3) The MSEL pin settings vary for different data width, configuration voltage standards, and POR delay. To connect MSEL, refer to the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.
- (4) If you use FPP ×8, use DATA[7..0]. If you use FPP ×16, use DATA[15..0].

## FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is 1.

**Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 <sup>(1), (2)</sup>**

### Notes to Figure 12:

- (1) Use this timing waveform when the DCLK-to-DATA [] ratio is 1.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF\_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (4) After power-up, before and during configuration, CONF\_DONE is low.
- (5) Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
- (6) For FPP x16, use DATA [15..0]. For FPP x8, use DATA [7..0]. DATA [31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.
- (7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF\_DONE is released high when the Stratix V device receives all the configuration data successfully. After CONF\_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (8) After the option bit to enable the INIT\_DONE pin is configured into the device, the INIT\_DONE goes low.

Table 51 lists the timing parameters for Stratix V devices for FPP configuration when the DCLK-to-DATA [] ratio is more than 1.

$t_{CD2UMC}$	CONF_DONE high to user mode with CLKUSR option on	$t_{CD2CU} + (8576 \times \text{CLKUSR period})$ <sup>(4)</sup>	—	—

**Notes to Table 51:**

- (1) Use these timing parameters when you use the decompression and design security features.
- (2) You can obtain this value if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (3) The minimum and maximum numbers apply only if you use the internal oscillator as the clock source for initializing the device.
- (4) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.
- (5) N is the DCLK-to-DATA ratio and  $f_{DCLK}$  is the DCLK frequency the system is operating.
- (6) If nSTATUS is monitored, follow the  $t_{ST2CK}$  specification. If nSTATUS is not monitored, follow the  $t_{CF2CK}$  specification.
