### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

- (4) The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

OCT calibration is automatically performed at power-up for OCT-enabled I/Os. Table 13 lists the OCT variation with temperature and voltage after power-up calibration. Use Table 13 to determine the OCT variation after power-up calibration and Equation 1 to determine the OCT variation without recalibration.

**Equation 1. OCT Variation Without Recalibration for Stratix V Devices <sup>(1), (2), (3), (4), (5), (6)</sup>**

$$R_{OCT} = R_{SCAL} \left( 1 + \left\langle \frac{dR}{dT} \times \Delta T \right\rangle \pm \left\langle \frac{dR}{dV} \times \Delta V \right\rangle \right)$$

**Notes to Equation 1:**

- (1) The R<sub>OCT</sub> value shows the range of OCT resistance with the variation of temperature and V<sub>CCIO</sub>.
- (2) R<sub>SCAL</sub> is the OCT resistance value at power-up.
- (3) ΔT is the variation of temperature with respect to the temperature at power-up.
- (4) ΔV is the variation of voltage with respect to the V<sub>CCIO</sub> at power-up.
- (5) dR/dT is the percentage change of R<sub>SCAL</sub> with temperature.

**Notes to Table 28:**

- (1) Speed grades shown refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.
- (2) The reference clock common mode voltage is equal to the VCCR\_GXB power supply level.
- (3) The device cannot tolerate prolonged operation at this absolute maximum.
- (4) The differential eye opening specification at the receiver input pins assumes that receiver equalization is disabled. If you enable receiver equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (5) Refer to Figure 5 for the GT channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (6) Refer to Figure 6 for the GT channel DC gain curves.
- (7) CFP2 optical modules require the host interface to have the receiver data pins differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (8) Specifications for this parameter are the same as for Stratix V GX and GS devices. See Table 23 for specifications.
- (9)  $t_{LTR}$  is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (10)  $t_{LTD}$  is time required for the receiver CDR to start recovering valid data after the  $rx\_is\_lockedto\ data$  signal goes high.
- (11)  $t_{LTD\_manual}$  is the time required for the receiver CDR to start recovering valid data after the  $rx\_is\_lockedto\ data$  signal goes high when the CDR is functioning in the manual mode.
- (12)  $t_{LTR\_LTD\_manual}$  is the time the receiver CDR must be kept in lock to reference (LTR) mode after the  $rx\_is\_lockedto\ ref$  signal goes high when the CDR is functioning in the manual mode.
- (13)  $tp11\_powerdown$  is the PLL powerdown minimum pulse width.
- (14)  $tp11\_lock$  is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (15) To calculate the REFCLK rms phase jitter requirement for PCIe at reference clock frequencies other than 100 MHz, use the following formula:  
REFCLK rms phase jitter at f(MHz) = REFCLK rms phase jitter at 100 MHz × 100/f.
- (16) The maximum peak to peak differential input voltage  $V_{ID}$  after device configuration is equal to  $4 \times (\text{absolute } V_{MAX} \text{ for receiver pin} - V_{ICM})$ .
- (17) For ES devices, RREF is 2000 Ω ±1%.
- (18) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at f(MHz) = REFCLK phase noise at 622 MHz + 20\*log(f/622).
- (19) SFP/+ optical modules require the host interface to have RD+/- differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (20) Refer to Figure 4.
- (21) For oversampling design to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (22) This supply follows VCCR\_GXB for both GX and GT channels.

## Core Performance Specifications

This section describes the clock tree, phase-locked loop (PLL), digital signal processing (DSP), memory blocks, configuration, and JTAG specifications.

### Clock Tree Specifications

Table 30 lists the clock tree specifications for Stratix V devices.

**Table 30. Clock Tree Performance for Stratix V Devices <sup>(1)</sup>**

Symbol	Performance			Unit
	C1, C2, C2L, I2, and I2L	C3, I3, I3L, and I3YY	C4, I4	
Global and Regional Clock	717	650	580	MHz
Periphery Clock	550	500	500	MHz

**Note to Table 30:**

(1) The Stratix V ES devices are limited to 600 MHz core clock tree performance.

**Table 31. PLL Specifications for Stratix V Devices (Part 3 of 3)**

Symbol	Parameter	Min	Typ	Max	Unit
$f_{RES}$	Resolution of VCO frequency ( $f_{INPFD} = 100$ MHz)	390625	5.96	0.023	Hz

**Notes to Table 31:**

- (1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.
- (2) This specification is limited by the lower of the two: I/O  $f_{MAX}$  or  $f_{OUT}$  of the PLL.
- (3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source < 120 ps.
- (4)  $f_{REF}$  is  $f_{IN}/N$  when  $N = 1$ .
- (5) Peak-to-peak jitter with a probability level of  $10^{-12}$  (14 sigma, 99.9999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 44 on page 52.
- (6) The cascaded PLL specification is only applicable with the following condition:
  - a. Upstream PLL:  $0.59\text{MHz} \leq \text{Upstream PLL BW} < 1$  MHz
  - b. Downstream PLL: Downstream PLL BW > 2 MHz
- (7) High bandwidth PLL settings are not supported in external feedback mode.
- (8) The external memory interface clock output jitter specifications use a different measurement method, which is available in Table 42 on page 50.
- (9) The VCO frequency reported by the Quartus II software in the PLL Usage Summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the  $f_{VCO}$  specification.
- (10) This specification only covers fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.05 - 0.95 must be  $\geq 1000$  MHz, while  $f_{VCO}$  for fractional value range 0.20 - 0.80 must be  $\geq 1200$  MHz.
- (11) This specification only covered fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.05-0.95 must be  $\geq 1000$  MHz.
- (12) This specification only covered fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.20-0.80 must be  $\geq 1200$  MHz.

**Notes to Table 36:**

- (1) When J = 3 to 10, use the serializer/deserializer (SERDES) block.
- (2) When J = 1 or 2, bypass the SERDES block.
- (3) This only applies to DPA and soft-CDR modes.
- (4) Clock Boost Factor (W) is the ratio between the input data rate to the input clock rate.
- (5) This is achieved by using the **LVDS** clock network.
- (6) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.
- (7) The maximum ideal frequency is the SERDES factor (J) x the PLL maximum output frequency (f<sub>OUT</sub>) provided you can close the design timing and the signal integrity simulation is clean.
- (8) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and receiver sampling margin to determine the maximum data rate supported.
- (9) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.
- (10) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.
- (11) The F<sub>MAX</sub> specification is based on the fast clock used for serial data. The interface F<sub>MAX</sub> is also dependent on the parallel clock domain which is design-dependent and requires timing analysis.
- (12) Stratix V RX LVDS will need DPA. For Stratix V TX LVDS, the receiver side component must have DPA.
- (13) Stratix V LVDS serialization and de-serialization factor needs to be x4 and above.
- (14) Requires package skew compensation with PCB trace length.
- (15) Do not mix single-ended I/O buffer within LVDS I/O bank.
- (16) Chip-to-chip communication only with a maximum load of 5 pF.
- (17) When using True LVDS RX channels for emulated LVDS TX channel, only serialization factors 1 and 2 are supported.

**Table 46. JTAG Timing Parameters and Values for Stratix V Devices**

$t_{JPCO}$	JTAG port clock to output	—	11 <sup>(1)</sup>	ns
$t_{JPZX}$	JTAG port high impedance to valid output	—	14 <sup>(1)</sup>	ns
$t_{JPXZ}$	JTAG port valid output to high impedance	—	14 <sup>(1)</sup>	ns

**Notes to Table 46:**

- (1) A 1 ns adder is required for each  $V_{CCIO}$  voltage step down from 3.0 V. For example,  $t_{JPCO}$  = 12 ns if  $V_{CCIO}$  of the TDO I/O bank = 2.5 V, or 13 ns if it equals 1.8 V.
- (2) The minimum TCK clock period is 167 ns if VCCBAT is within the range 1.2V-1.5V when you perform the volatile key programming.

## Fast Passive Parallel Configuration Timing

This section describes the fast passive parallel (FPP) configuration timing parameters for Stratix V devices.

### DCLK-to-DATA[] Ratio for FPP Configuration

FPP configuration requires a different DCLK-to-DATA [] ratio when you enable the design security, decompression, or both features. Table 49 lists the DCLK-to-DATA [] ratio for each combination.

**Table 49. DCLK-to-DATA[] Ratio <sup>(1)</sup> (Part 1 of 2)**

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×8	Disabled	Disabled	1
	Disabled	Enabled	1

## FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is 1.

**Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 <sup>(1), (2)</sup>**

### Notes to Figure 12:

- (1) Use this timing waveform when the DCLK-to-DATA [] ratio is 1.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF\_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (4) After power-up, before and during configuration, CONF\_DONE is low.
- (5) Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
- (6) For FPP  $\times 16$ , use DATA [15..0]. For FPP  $\times 8$ , use DATA [7..0]. DATA [31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.
- (7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF\_DONE is released high when the Stratix V device receives all the configuration data successfully. After CONF\_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (8) After the option bit to enable the INIT\_DONE pin is configured into the device, the INIT\_DONE goes low.

Table 50 lists the timing parameters for Stratix V devices for FPP configuration when the DCLK-to-DATA [] ratio is 1.

t <sub>CD2UM</sub>	CONF_DONE high to user mode <sup>(4)</sup>	175	437	μs
t <sub>CD2CU</sub>	CONF_DONE high to CLKUSR enabled	4 × maximum DCLK period	—	—
t <sub>CD2UMC</sub>	CONF_DONE high to user mode with CLKUSR option on	t <sub>CD2CU</sub> + (8576 × CLKUSR period) <sup>(5)</sup>	—	—

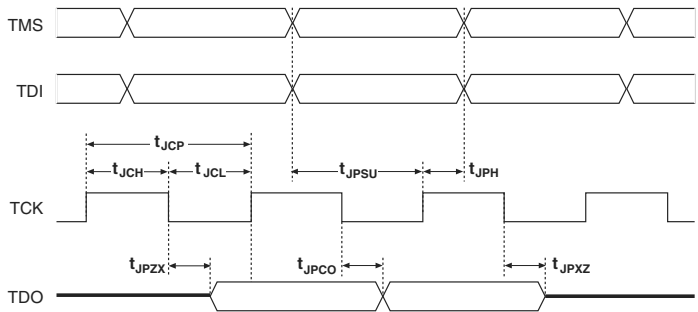

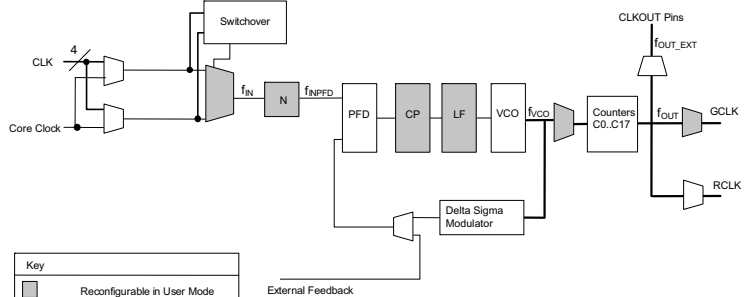

**Notes to Table 50:**

- (1) Use these timing parameters when the decompression and design security features are disabled.
- (2) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (3) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.
- (4) The minimum and maximum numbers apply only if you chose the internal oscillator as the clock source for initializing the device.
- (5) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.
- (6) If nSTATUS is monitored, follow the t<sub>ST2CK</sub> specification. If nSTATUS is not monitored, follow the t<sub>CF2CK</sub> specification.

### FPP Configuration Timing when DCLK-to-DATA [] > 1

Figure 13 shows the timing waveform for FPP configuration when using a MAX II device, MAX V device, or microprocessor as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is more than 1.
