Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Calibration accuracy for the calibrated series and parallel OCTs are applicable at the moment of calibration. When voltage and temperature conditions change after calibration, the tolerance may change.

OCT calibration is automatically performed at power-up for OCT-enabled I/Os. Table 13 lists the OCT variation with temperature and voltage after power-up calibration. Use Table 13 to determine the OCT variation after power-up calibration and Equation 1 to determine the OCT variation without recalibration.

Equation 1. OCT Variation Without Recalibration for Stratix V Devices *(1), (2), (3), (4), (5), (6)*

$$R_{OCT} = R_{SCAL}\left(1 + \langle \frac{dR}{dT} \times \Delta T\rangle \pm \langle \frac{dR}{dV} \times \Delta V\rangle\right)$$

Notes to Equation 1:

(1) The R_{OCT} value shows the range of OCT resistance with the variation of temperature and V_{CCIO}.

(2) R_{SCAL} is the OCT resistance value at power-up.

(3) ΔT is the variation of temperature with respect to the temperature at power-up.

(4) ΔV is the variation of voltage with respect to the V_{CCIO} at power-up.

(5) dR/dT is the percentage change of R_{SCAL} with temperature.

(6) dR/dV is the percentage change of R_{SCAL} with voltage.

You typically use the interactive Excel-based Early Power Estimator before designing the FPGA to get a magnitude estimate of the device power. The Quartus II PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yields very accurate power estimates.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

Table 40. DQS Phase Offset Delay Per Setting for Stratix V Devices (1), (2) (Part 2 of 2)

Speed Grade	Min	Max	Unit
C4,I4	8	16	ps

Notes to Table 40:

(1) The typical value equals the average of the minimum and maximum values.

(2) The delay settings are linear with a cumulative delay variation of 40 ps for all speed grades. For example, when using a –2 speed grade and applying a 10-phase offset setting to a 90° phase shift at 400 MHz, the expected average cumulative delay is [625 ps + (10 × 10 ps) ± 20 ps] = 725 ps ± 20 ps.

Table 41 lists the DQS phase shift error for Stratix V devices.

Notes to Table 42:

(2) The clock jitter specification applies to the memory output clock pins clocked by an integer PLL.

(3) The memory output clock jitter is applicable when an input jitter of 30 ps peak-to-peak is applied with bit error rate (BER) -12, equivalent to 14 sigma.

Fast Passive Parallel Configuration Timing

This section describes the fast passive parallel (FPP) configuration timing parameters for Stratix V devices.

DCLK-to-DATA[] Ratio for FPP Configuration

FPP configuration requires a different `DCLK`-to-`DATA[]` ratio when you enable the design security, decompression, or both features. Table 49 lists the `DCLK`-to-`DATA[]` ratio for each combination.

Table 49. DCLK-to-DATA[] Ratio (1) (Part 1 of 2)

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×8	Disabled	Disabled	1
	Disabled	Enabled	1
	Enabled	Disabled	2
	Enabled	Enabled	2
FPP ×16	Disabled	Disabled	1
	Disabled	Enabled	2
	Enabled	Disabled	4
	Enabled	Enabled	4

Table 49. DCLK-to-DATA[] Ratio (1) (Part 2 of 2)

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×32	Disabled	Disabled	1
	Disabled	Enabled	4
	Enabled	Disabled	8
	Enabled	Enabled	8

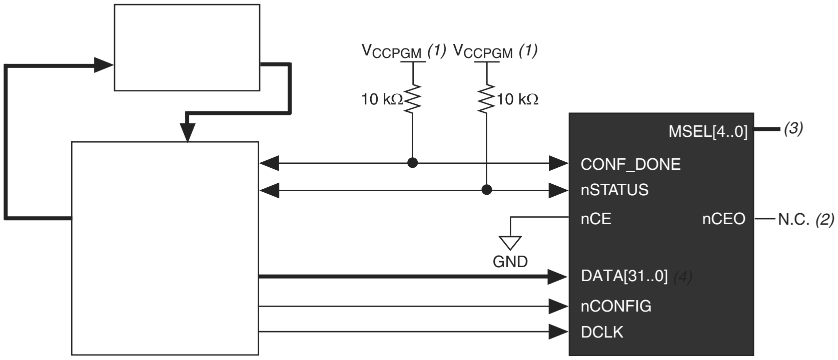
Note to Table 49:

(1) Depending on the `DCLK`-to-`DATA[]` ratio, the host must send a `DCLK` frequency that is r times the data rate in bytes per second (Bps), or words per second (Wps). For example, in FPP ×16 when the `DCLK`-to-`DATA[]` ratio is 2, the `DCLK` frequency must be 2 times the data rate in Wps. Stratix V devices use the additional clock cycles to decrypt and decompress the configuration data.

If the `DCLK`-to-`DATA[]` ratio is greater than 1, at the end of configuration, you can only stop the `DCLK` (`DCLK`-to-`DATA[]` ratio – 1) clock cycles after the last data is latched into the Stratix V device.

Figure 11 shows the configuration interface connections between the Stratix V device and a MAX II or MAX V device for single device configuration.

Figure 11. Single Device FPP Configuration Using an External Host



Notes to Figure 11:

(1) Connect the resistor to a supply that provides an acceptable input signal for the Stratix V device. V_{CCPGM} must be high enough to meet the V_{IH} specification of the I/O on the device and the external host. Altera recommends powering up all configuration system I/Os with V_{CCPGM}.

(2) You can leave the `nCEO` pin unconnected or use it as a user I/O pin when it does not feed another device's `nCE` pin.

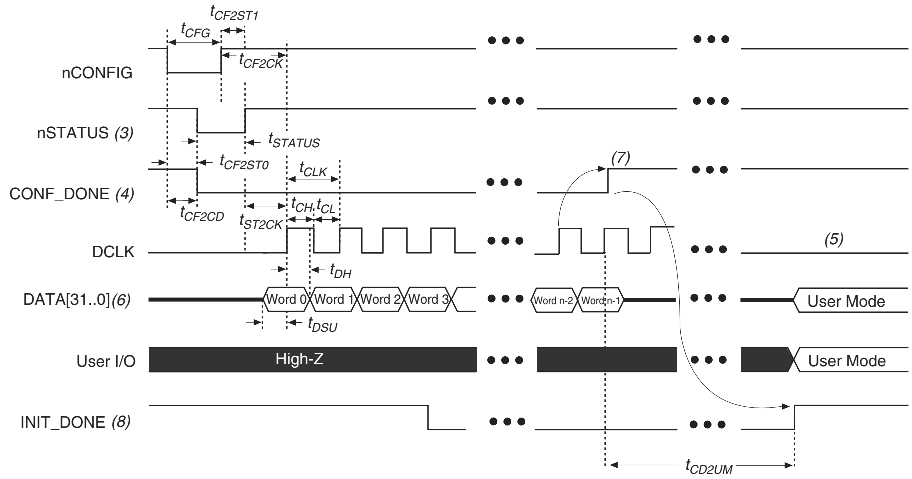
(3) The `MSEL` pin settings vary for different data width, configuration voltage standards, and POR delay. To connect `MSEL`, refer to the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

(4) If you use FPP ×8, use `DATA[7..0]`. If you use FPP ×16, use `DATA[15..0]`.

FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the `DCLK`-to-`DATA[]` ratio is 1.

Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 *(1), (2)*



Notes to Figure 12:

(1) Use this timing waveform when the `DCLK`-to-`DATA[]` ratio is 1.

(2) The beginning of this waveform shows the device in user mode. In user mode, `nCONFIG`, `nSTATUS`, and `CONF_DONE` are at logic-high levels. When `nCONFIG` is pulled low, a reconfiguration cycle begins.

(3) After power-up, the Stratix V device holds `nSTATUS` low for the time of the POR delay.

(4) After power-up, before and during configuration, `CONF_DONE` is low.

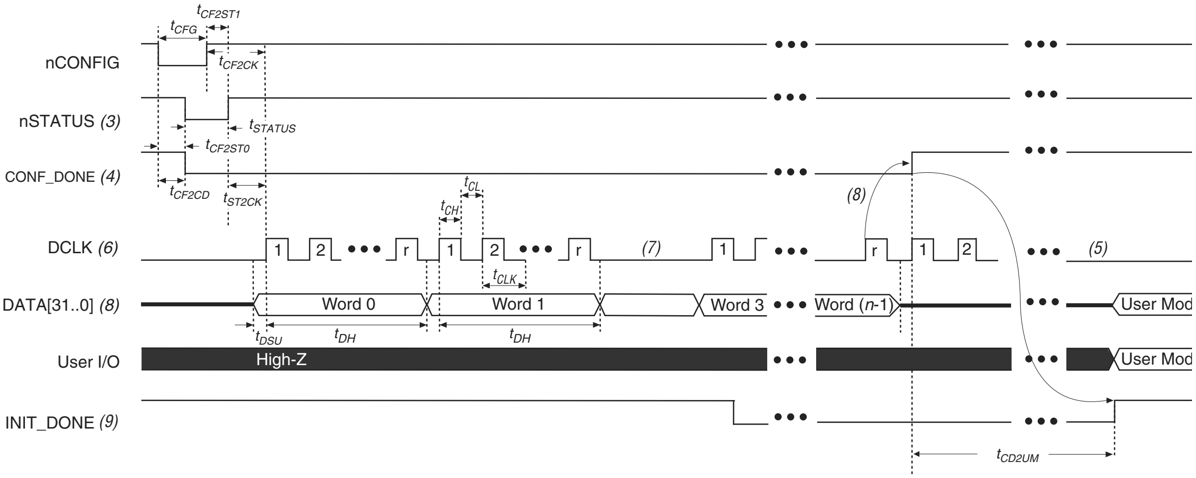
(5) Do not leave `DCLK` floating after configuration. `DCLK` is ignored after configuration is complete. It can toggle high or low if required.

(6) For FPP ×16, use `DATA[15..0]`. For FPP ×8, use `DATA[7..0]`. `DATA[31..0]` are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.

(7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. `CONF_DONE` is released high when the Stratix V device receives all the configuration data successfully. After `CONF_DONE` goes high, send two additional falling edges on `DCLK` to begin initialization and enter user mode.

(8) After the option bit to enable the `INIT_DONE` pin is configured into the device, the `INIT_DONE` goes low.

Figure 13. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is >1 *(1), (2)*



Notes to Figure 13:

(1) Use this timing waveform and parameters when the `DCLK`-to-`DATA[]` ratio is >1. To find out the `DCLK`-to-`DATA[]` ratio for your system, refer to Table 49 on page 55.

(2) The beginning of this waveform shows the device in user mode. In user mode, `nCONFIG`, `nSTATUS`, and `CONF_DONE` are at logic high levels. When `nCONFIG` is pulled low, a reconfiguration cycle begins.

(3) After power-up, the Stratix V device holds `nSTATUS` low for the time as specified by the POR delay.

(4) After power-up, before and during configuration, `CONF_DONE` is low.

(5) Do not leave `DCLK` floating after configuration. You can drive it high or low, whichever is more convenient.

(6) "r" denotes the `DCLK`-to-`DATA[]` ratio. For the `DCLK`-to-`DATA[]` ratio based on the decompression and the design security feature enable settings, refer to Table 49 on page 55.

(7) If needed, pause `DCLK` by holding it low. When `DCLK` restarts, the external host must provide data on the `DATA[31..0]` pins prior to sending the first `DCLK` rising edge.

(8) To ensure a successful configuration, send the entire configuration data to the Stratix V device. `CONF_DONE` is released high after the Stratix V device receives all the configuration data successfully. After `CONF_DONE` goes high, send two additional falling edges on `DCLK` to begin initialization and enter user mode.

(9) After the option bit to enable the `INIT_DONE` pin is configured into the device, the `INIT_DONE` goes low.

Table 51 lists the timing parameters for Stratix V devices for FPP configuration when the `DCLK`-to-`DATA[]` ratio is more than 1.

(4) To enable the `CLKUSR` pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

(6) If `nSTATUS` is monitored, follow the t_{ST2CK} specification. If `nSTATUS` is not monitored, follow the t_{CF2CK} specification.

Table 54 lists the PS configuration timing parameters for Stratix V devices.

Notes to Table 54:

(1) This value is applicable if you do not delay configuration by extending the `nCONFIG` or `nSTATUS` low pulse width.

(2) This value is applicable if you do not delay configuration by externally holding the `nSTATUS` low.
