Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Table 8 shows the transceiver power supply voltage requirements for various conditions.

Table 8. Transceiver Power Supply Voltage Requirements

Conditions	Core Speed Grade	VCCR_GXB & VCCT_GXB *(2)*	VCCA_GXB	VCCH_GXB	Unit
If BOTH of the following conditions are true: ■ Data rate > 10.3 Gbps. ■ DFE is used.	All	1.05	3.0	1.5	V
If ANY of the following conditions are true *(1)*: ■ ATX PLL is used. ■ Data rate > 6.5Gbps. ■ DFE (data rate ≤ 10.3 Gbps), AEQ, or EyeQ feature is used.	All	1.0			
If ALL of the following conditions are true: ■ ATX PLL is not used. ■ Data rate ≤ 6.5Gbps. ■ DFE, AEQ, and EyeQ are not used.	C1, C2, I2, and I3YY	0.90	2.5		
	C2L, C3, C4, I2L, I3, I3L, and I4	0.85	2.5		

Notes to Table 8:

(1) Choose this power supply voltage requirement option if you plan to upgrade your design later with any of the listed conditions.

(2) If the VCCR_GXB and VCCT_GXB supplies are set to 1.0 V or 1.05 V, they cannot be shared with the VCC core supply. If the VCCR_GXB and VCCT_GXB are set to either 0.90 V or 0.85 V, they can be shared with the VCC core supply.

DC Characteristics

This section lists the supply current, I/O pin leakage current, input pin capacitance, on-chip termination tolerance, and hot socketing specifications.

Supply Current

Supply current is the current drawn from the respective power rails used for power budgeting. Use the Excel-based Early Power Estimator (EPE) to get supply current estimates for your design because these currents vary greatly with the resources you use.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

I/O Pin Leakage Current

Table 9 lists the Stratix V I/O pin leakage current specifications.

Table 9. I/O Pin Leakage Current for Stratix V Devices (1)

Symbol	Description	Conditions	Min	Typ	Max	Unit
I_I	Input pin	V_I = 0 V to $V_{CCIOMAX}$	–30	—	30	µA
I_{OZ}	Tri-stated I/O pin	V_O = 0 V to $V_{CCIOMAX}$	–30	—	30	µA

Note to Table 9:

(1) If V_O = V_{CCIO} to $V_{CCIOMax}$, 100 µA of leakage current per I/O is expected.

Bus Hold Specifications

Table 10 lists the Stratix V device family bus hold specifications.

Table 10. Bus Hold Parameters for Stratix V Devices

On-Chip Termination (OCT) Specifications

If you enable OCT calibration, calibration is automatically performed at power-up for I/Os connected to the calibration block. Table 11 lists the Stratix V OCT termination calibration accuracy specifications.

Table 11. OCT Calibration Accuracy Specifications for Stratix V Devices (1) (Part 1 of 2)

Switching Characteristics

This section provides performance characteristics of the Stratix V core and periphery blocks.

These characteristics can be designated as Preliminary or Final.

- Preliminary characteristics are created using simulation results, process data, and other known parameters. The title of these tables show the designation as "Preliminary."
- Final numbers are based on actual silicon characterization and testing. The numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. There are no designations on finalized tables.

Transceiver Performance Specifications

This section describes transceiver performance specifications.

Notes to Table 33:

(1) To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL set to **50%** output duty cycle. Use the Quartus II software to report timing for this and other memory block clocking schemes.

(2) When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in F_{MAX}.

(3) The F_{MAX} specification is only achievable with Fitter options, **MLAB Implementation In 16-Bit Deep Mode** enabled.

Periphery Performance

This section describes periphery performance, including high-speed I/O and external memory interface.

I/O performance supports several system interfaces, such as the **LVDS** high-speed I/O interface, external memory interface, and the **PCI/PCI-X** bus interface. General-purpose I/O standards such as 3.3-, 2.5-, 1.8-, and 1.5-**LVTTL/LVCMOS** are capable of a typical 167 MHz and 1.2-**LVCMOS** at 100 MHz interfacing frequency with a 10 pF load.

The actual achievable frequency depends on design- and system-specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

High-Speed I/O Specification

Table 36 lists high-speed I/O timing for Stratix V devices.

Table 36. High-Speed I/O Specifications for Stratix V Devices (1), (2) (Part 1 of 4)

Note to Table 39:

(1) Stratix V devices support memory interface frequencies lower than 300 MHz, although the reference clock that feeds the DLL must be at least 300 MHz. To support interfaces below 300 MHz, multiply the reference clock feeding the DLL to ensure the frequency is within the supported range of the DLL.

Configuration Specification

POR Delay Specification

Power-on reset (POR) delay is defined as the delay between the time when all the power supplies monitored by the POR circuitry reach the minimum recommended operating voltage to the time when the `nSTATUS` is released high and your device is ready to begin configuration.

For more information about the POR delay, refer to the *Hot Socketing and Power-On Reset in Stratix V Devices* chapter.

Table 45 lists the fast and standard POR delay specification.

Table 45. Fast and Standard POR Delay Specification *(1)*

POR Delay	Minimum	Maximum
Fast	4 ms	12 ms
Standard	100 ms	300 ms

Note to Table 45:

(1) You can select the POR delay based on the `MSEL` settings as described in the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

JTAG Configuration Specifications

Table 46 lists the JTAG timing parameters and values for Stratix V devices.

Notes to Table 48:

(1) DCLK frequency of 100 MHz using external CLKUSR.

(2) Max FPGA FPP bandwidth may exceed bandwidth available from some external storage or control logic.

Fast Passive Parallel Configuration Timing

This section describes the fast passive parallel (FPP) configuration timing parameters for Stratix V devices.

DCLK-to-DATA[] Ratio for FPP Configuration

FPP configuration requires a different `DCLK`-to-`DATA[]` ratio when you enable the design security, decompression, or both features. Table 49 lists the `DCLK`-to-`DATA[]` ratio for each combination.

Table 49. DCLK-to-DATA[] Ratio (1) (Part 1 of 2)

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×8	Disabled	Disabled	1
	Disabled	Enabled	1
	Enabled	Disabled	2
	Enabled	Enabled	2
FPP ×16	Disabled	Disabled	1
	Disabled	Enabled	2
	Enabled	Disabled	4

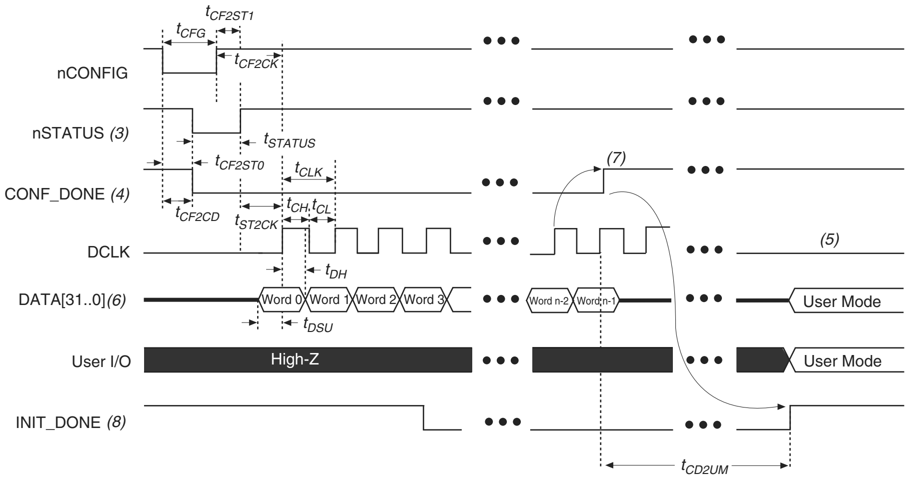
FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the `DCLK`-to-`DATA[]` ratio is 1.

Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 *(1), (2)*



Notes to Figure 12:

(1) Use this timing waveform when the `DCLK`-to-`DATA[]` ratio is 1.

(2) The beginning of this waveform shows the device in user mode. In user mode, `nCONFIG`, `nSTATUS`, and `CONF_DONE` are at logic-high levels. When `nCONFIG` is pulled low, a reconfiguration cycle begins.

(3) After power-up, the Stratix V device holds `nSTATUS` low for the time of the POR delay.

(4) After power-up, before and during configuration, `CONF_DONE` is low.

(5) Do not leave `DCLK` floating after configuration. `DCLK` is ignored after configuration is complete. It can toggle high or low if required.

(6) For FPP ×16, use `DATA[15..0]`. For FPP ×8, use `DATA[7..0]`. `DATA[31..0]` are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.

(7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. `CONF_DONE` is released high when the Stratix V device receives all the configuration data successfully. After `CONF_DONE` goes high, send two additional falling edges on `DCLK` to begin initialization and enter user mode.

(8) After the option bit to enable the `INIT_DONE` pin is configured into the device, the `INIT_DONE` goes low.

Table 53. AS Timing Parameters for AS ×1 and AS ×4 Configurations in Stratix V Devices (1), (2) (Part 2 of 2)

Symbol	Parameter	Minimum	Maximum	Units
t_{CD2UM}	`CONF_DONE` high to user mode (3)	175	437	µs
t_{CD2CU}	`CONF_DONE` high to `CLKUSR` enabled	4 × maximum `DCLK` period	—	—
t_{CD2UMC}	`CONF_DONE` high to user mode with `CLKUSR` option on	t_{CD2CU} + (8576 × `CLKUSR` period)	—	—

Notes to Table 53:

(1) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

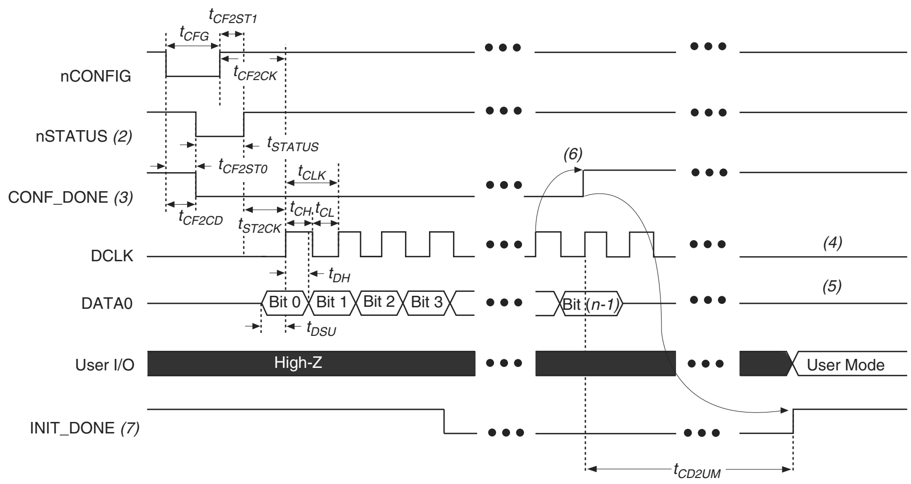
(2) t_{CF2CD}, t_{CF2ST0}, t_{CFG}, t_{STATUS}, and t_{CF2ST1} timing parameters are identical to the timing parameters for PS mode listed in Table 54 on page 63.

(3) To enable the `CLKUSR` pin as the initialization clock source and to obtain the maximum frequency specification on this pin, refer to the Initialization section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

Passive Serial Configuration Timing

Figure 15 shows the timing waveform for a passive serial (PS) configuration when using a MAX II device, MAX V device, or microprocessor as an external host.

Figure 15. PS Configuration Timing Waveform (1)



Notes to Figure 15:

(1) The beginning of this waveform shows the device in user mode. In user mode, `nCONFIG`, `nSTATUS`, and `CONF_DONE` are at logic high levels. When `nCONFIG` is pulled low, a reconfiguration cycle begins.

(2) After power-up, the Stratix V device holds `nSTATUS` low for the time of the POR delay.

(3) After power-up, before and during configuration, `CONF_DONE` is low.

(4) Do not leave `DCLK` floating after configuration. You can drive it high or low, whichever is more convenient.

(5) `DATA0` is available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings in the **Device and Pins Option**.

(6) To ensure a successful configuration, send the entire configuration data to the Stratix V device. `CONF_DONE` is released high after the Stratix V device receives all the configuration data successfully. After `CONF_DONE` goes high, send two additional falling edges on `DCLK` to begin initialization and enter user mode.

(7) After the option bit to enable the `INIT_DONE` pin is configured into the device, the `INIT_DONE` goes low.

Remote System Upgrades

Table 56 lists the timing parameter specifications for the remote system upgrade circuitry.

Table 56. Remote System Upgrade Circuitry Timing Specifications

Parameter	Minimum	Maximum	Unit
$t_{RU\_nCONFIG}$ *(1)*	250	—	ns
$t_{RU\_nRSTIMER}$ *(2)*	250	—	ns

Notes to Table 56:

(1) This is equivalent to strobing the reconfiguration input of the ALTREMOTE_UPDATE megafunction high for the minimum timing specification. For more information, refer to the Remote System Upgrade State Machine section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.

(2) This is equivalent to strobing the reset_timer input of the ALTREMOTE_UPDATE megafunction high for the minimum timing specification. For more information, refer to the User Watchdog Timer section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.

I/O Timing

Altera offers two ways to determine I/O timing—the Excel-based I/O Timing and the Quartus II Timing Analyzer.

Excel-based I/O timing provides pin timing performance for each device density and speed grade. The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis. The Quartus II Timing Analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after you complete place-and-route.

You can download the Excel-based I/O Timing spreadsheet from the Stratix V Devices Documentation web page.
