#### Understanding <u>Embedded - FPGAs (Field</u> <u>Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

#### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Details	
Product Status	Obsolete
Number of LABs/CLBs	317000
Number of Logic Elements/Cells	840000
Total RAM Bits	53248000
Number of I/O	840
Number of Gates	-
Voltage - Supply	0.87V ~ 0.93V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1932-BBGA, FCBGA
Supplier Device Package	1932-FBGA, FC (45x45)
Purchase URL	https://www.e-xfl.com/product-detail/intel/5sgxea9n3f45c2n

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Table 7.	Recommended Transceiver Power Supply Operating Conditions for Stratix V GX,	GS, and GT Devices
(Part 2	of 2)	

## Notes to Table 7:

(1) This supply must be connected to 3.0 V if the CMU PLL, receiver CDR, or both, are configured at a base data rate > 6.5 Gbps. Up to 6.5 Gbps, you can connect this supply to either 3.0 V or 2.5 V.

(2) Refer to Table 8 to select the correct power supply level for your design.

(3) When using ATX PLLs, the supply must be 3.0 V.

(4) This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

## I/O Pin Leakage Current

Table 9 lists the Stratix V I/O pin leakage current specifications.

Table 9. I/	0 Pin Leakage	<b>Current for Stratix </b>	/ Devices <sup>(1)</sup>
-------------	---------------	-----------------------------	--------------------------

Symbol	Description	Conditions	Min	Тур	Max	Unit
I <sub>I</sub>	Input pin	$V_I = 0 V \text{ to } V_{CCIOMAX}$	-30	—	30	μA
I <sub>0Z</sub>	Tri-stated I/O pin	$V_0 = 0 V$ to $V_{CCIOMAX}$	-30		30	μA

## Note to Table 9:

(1) If  $V_0 = V_{CCIO}$  to  $V_{CCIOMax}$ , 100  $\mu$ A of leakage current per I/O is expected.

## **Bus Hold Specifications**

Table 10 lists the Stratix V device family bus hold specifications.

Table 10. Bus Hold Parameters for Stratix V Devices

			V <sub>CCIO</sub>										
Parameter	Symbol	Conditions	1.2	2 V	1.	5 V	1.8	B V	2.	5 V	3.0	V	Unit

#### Table 23. Transceiver Specifications for Stratix V GX and GS Devices <sup>(1)</sup> (Part 7 of 7)

#### Notes to Table 23:

(2) The reference clock common mode voltage is equal to the V<sub>CCR\_GXB</sub> power supply level.

(3) This supply must be connected to 1.0 V if the transceiver is configured at a data rate > 6.5 Gbps, and to 1.05 V if configured at a data rate > 10.3 Gbps when DFE is used. For data rates up to 6.5 Gbps, you can connect this supply to 0.85 V.

- (4) This supply follows VCCR\_GXB.
- (5) The device cannot tolerate prolonged operation at this absolute maximum.
- (6) The differential eye opening specification at the receiver input pins assumes that **Receiver Equalization** is disabled. If you enable **Receiver Equalization**, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (7) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.
- (8) The input reference clock frequency options depend on the data rate and the device speed grade.
- (9) The line data rate may be limited by PCS-FPGA interface speed grade.
- (10) Refer to Figure 1 for the GX channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (11) t<sub>LTR</sub> is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (12) t<sub>LTD</sub> is time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high.
- (13) t<sub>LTD\_manual</sub> is the time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high when the CDR is functioning in the manual mode.
- (14)  $t_{LTR\_LTD\_manual}$  is the time the receiver CDR must be kept in lock to reference (LTR) mode after the rx\_is\_lockedtoref signal goes high when the CDR is functioning in the manual mode.
- (15)  $t_{pll_powerdown}$  is the PLL powerdown minimum pulse width.
- (16) t<sub>pll lock</sub> is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (17) To calculate the REFCLK rms phase jitter requirement for PCIe at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f(MHz) = REFCLK rms phase jitter at 100 MHz × 100/f.
- (18) The maximum peak to peak differential input voltage  $V_{ID}$  after device configuration is equal to 4 × (absolute  $V_{MAX}$  for receiver pin  $V_{ICM}$ ).
- (19) For ES devices,  $R_{BEF}$  is 2000  $\Omega \pm 1\%$ .
- (20) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at f(MHz) = REFCLK phase noise at 622 MHz + 20\*log(f/622).
- (21) SFP/+ optical modules require the host interface to have RD+/- differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (22) Refer to Figure 2.
- (23) For oversampling designs to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (24) I3YY devices can achieve data rates up to 10.3125 Gbps.
- (25) When you use fPLL as a TXPLL of the transceiver.
- (26) REFCLK performance requires to meet transmitter REFCLK phase noise specification.
- (27) Minimum eye opening of 85 mV is only for the unstressed input eye condition.

<sup>(1)</sup> Speed grades shown in Table 23 refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the Stratix V Device Overview.

Table 26 shows the approximate maximum data rate using the 10G PCS.

Table 26. Stratix V 10G PCS Approximate Maximum Data Rate (1)

## Table 36. High-Speed I/O Specifications for Stratix V Devices <sup>(1), (2)</sup> (Part 4 of 4)

Notes to Table 36:

(1) When J = 3 to 10, use the serializer/deserializer (SERDES) block.

(2) When J = 1 or 2, bypass the SERDES block.

(3) This only applies to DPA and soft-CDR modes.

(4) Clock Boost Factor (W) is the ratio between the input data rate to the input clock rate.

(5) This is achieved by using the **LVDS** clock network.

(6) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.

(7) The maximum ideal frequency is the SERDES factor (J) x the PLL maximum output frequency (fOUT) provided you can close the design timing and the signal integrity simulation is clean.

(8) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and receiver sampling margin to determine the maximum data rate supported.

(9) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.

(10) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.

(11) The F<sub>MAX</sub> specification is based on the fast clock used for serial data. The interface F<sub>MAX</sub> is also dependent on the parallel clock domain which is design-dependent and requires timing analysis.

(12) Stratix V RX LVDS will need DPA. For Stratix V TX LVDS, the receiver side component must have DPA.

(13) Stratix V LVDS serialization and de-serialization factor needs to be x4 and above.

(14) Requires package skew compensation with PCB trace length.

(15) Do not mix single-ended I/O buffer within LVDS I/O bank.

(16) Chip-to-chip communication only with a maximum load of 5 pF.

(17) When using True LVDS RX channels for emulated LVDS TX channel, only serialization factors 1 and 2 are supported.

Figure 7 shows the dynamic phase alignment (DPA) lock time specifications with the DPA PLL calibration option enabled.

Figure 7. DPA Lock Time Specification with DPA PLL Calibration Enabled

rx_reset	i		
rx_dpa_locked			

Table 37 lists the DPA lock time specifications for Stratix V devices.

Table 37. DPA Lock Time Specifications for Stratix V GX Devices Only (1), (2), (3)

Standard	Training Pattern	Number of Data Transitions in One Repetition of the Training Pattern	Number of Repetitions per 256 Data Transitions <sup>(4)</sup>	Maximum
SPI-4	0000000001111111111	2	128	640 data transitions
Parallel Rapid I/O	00001111	2	128	640 data transitions
	10010000	4	64	640 data transitions
Miscellaneous	10101010	8	32	640 data transitions
	01010101	8	32	640 data transitions

#### Notes to Table 37:

(1) The DPA lock time is for one channel.

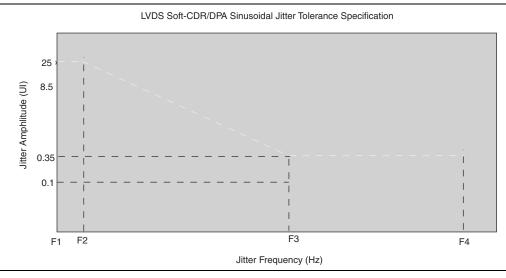

(2) One data transition is defined as a 0-to-1 or 1-to-0 transition.

(3) The DPA lock time stated in this table applies to both commercial and industrial grade.

(4) This is the number of repetitions for the stated training pattern to achieve the 256 data transitions.

Figure 8 shows the **LVDS** soft-clock data recovery (CDR)/DPA sinusoidal jitter tolerance specification for a data rate  $\geq$  1.25 Gbps. Table 38 lists the **LVDS** soft-CDR/DPA sinusoidal jitter tolerance specification for a data rate  $\geq$  1.25 Gbps.

Symbol	Description	Min	Max	Unit
t <sub>JPH</sub>	JTAG port hold time	5	_	ns
t <sub>JPCO</sub>	JTAG port clock to output	—	11 <sup>(1)</sup>	ns
t <sub>JPZX</sub>	JTAG port high impedance to valid output	—	14 <sup>(1)</sup>	ns
t <sub>JPXZ</sub>	JTAG port valid output to high impedance	—	<b>1</b> 4 <sup>(1)</sup>	ns

Table 46. JTAG Timing Parameters and Values for Stratix V Devices

Notes to Table 46:

(1) A 1 ns adder is required for each V<sub>CCI0</sub> voltage step down from 3.0 V. For example,  $t_{JPC0} = 12$  ns if V<sub>CCI0</sub> of the TDO I/O bank = 2.5 V, or 13 ns if it equals 1.8 V.

(2) The minimum TCK clock period is 167 ns if VCCBAT is within the range 1.2V-1.5V when you perform the volatile key programming.

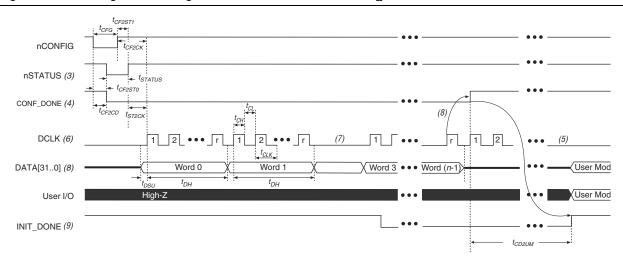

# **Raw Binary File Size**

For the POR delay specification, refer to the "POR Delay Specification" section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices".

Table 47 lists the uncompressed raw binary file (.rbf) sizes for Stratix V devices.

Family	Device	Package	Configuration .rbf Size (bits)	IOCSR .rbf Size (bits) <sup>(4), (5)</sup>
	5SGXA3	H35, F40, F35 <sup>(2)</sup>	213,798,880	562,392
		H29, F35 <sup>(3)</sup>	137,598,880	564,504
	5SGXA4	_	213,798,880	563,672

	5SGSD5	_	213,798,880	563,672
	5SGSD6	_	293,441,888	565,528
	5SGSD8	_	293,441,888	565,528

Table 47. Uncompressed .rbf Sizes for Stratix V Devices

#### Figure 13. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is >1 (1), (2)

#### Notes to Figure 13:

- (1) Use this timing waveform and parameters when the DCLK-to-DATA [] ratio is >1. To find out the DCLK-to-DATA [] ratio for your system, refer to Table 49 on page 55.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF\_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nSTATUS low for the time as specified by the POR delay.
- (4) After power-up, before and during configuration, CONF\_DONE is low.
- (5) Do not leave DCLK floating after configuration. You can drive it high or low, whichever is more convenient.
- (6) "r" denotes the DCLK-to-DATA [] ratio. For the DCLK-to-DATA [] ratio based on the decompression and the design security feature enable settings, refer to Table 49 on page 55.
- (7) If needed, pause DCLK by holding it low. When DCLK restarts, the external host must provide data on the DATA [31..0] pins prior to sending the first DCLK rising edge.
- (8) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF\_DONE is released high after the Stratix V device receives all the configuration data successfully. After CONF\_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (9) After the option bit to enable the INIT DONE pin is configured into the device, the INIT DONE goes low.

Table 54 lists the PS configuration timing parameters for Stratix V devices.

Table 54. PS Timing Parameters for Stratix V Devices

Symbol	Parameter	Minimum	Maximum	Units	
t <sub>CF2CD</sub>	nCONFIG low to CONF_DONE low	—	600	ns	
t <sub>CF2ST0</sub>	nCONFIG low to nSTATUS low	—	600	ns	
t <sub>CFG</sub>	nCONFIG low pulse width	2	—	μS	
t <sub>status</sub>	nSTATUS low pulse width	268	1,506 <sup>(1)</sup>	μS	
t <sub>CF2ST1</sub>	nCONFIG high to nSTATUS high	—	1,506 <sup>(2)</sup>	μS	
t <sub>CF2CK</sub> <sup>(5)</sup>	nCONFIG high to first rising edge on DCLK	1,506	—	μS	
t <sub>ST2CK</sub> <sup>(5)</sup>	nSTATUS high to first rising edge of DCLK	2	—	μS	
t <sub>DSU</sub>	DATA [] setup time before rising edge on DCLK	5.5	_	ns	
t <sub>DH</sub>	DATA [] hold time after rising edge on DCLK	0	_	ns	
t <sub>CH</sub>	DCLK high time	$0.45\times 1/f_{MAX}$	—	S	
t <sub>CL</sub>	DCLK low time	$0.45\times 1/f_{MAX}$	—	S	
t <sub>CLK</sub>	DCLK period	1/f <sub>MAX</sub>	_	S	
f <sub>MAX</sub>	DCLK frequency	—	125	MHz	
t <sub>CD2UM</sub>	CONF_DONE high to user mode <sup>(3)</sup>	175	437	μS	
t <sub>CD2CU</sub>	CONF_DONE high to CLKUSR enabled	4 × maximum DCLK period	_	_	
t <sub>CD2UMC</sub>	CONF_DONE high to user mode with CLKUSR option on	$\begin{array}{c} t_{\text{CD2CU}} + \\ (8576 \times \text{CLKUSR} \\ \text{period}) \ \ ^{(4)} \end{array}$	_	_	

#### Notes to Table 54:

(1) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

(2) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.

(3) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

(4) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the "Initialization" section.

(5) If nSTATUS is monitored, follow the t<sub>ST2CK</sub> specification. If nSTATUS is not monitored, follow the t<sub>CF2CK</sub> specification.

# Initialization

Table 55 lists the initialization clock source option, the applicable configuration schemes, and the maximum frequency.

Table 55. Initialization Clock Source Option and the Maximu
---

Initialization Clock Source	Configuration Schemes	Maximum Frequency	Minimum Number of Clock Cycles <sup>(1)</sup>
Internal Oscillator	AS, PS, FPP	12.5 MHz	
CLKUSR	AS, PS, FPP <sup>(2)</sup>	125 MHz	8576
DCLK	PS, FPP	125 MHz	

## Notes to Table 55:

(1) The minimum number of clock cycles required for device initialization.

(2) To enable CLKUSR as the initialization clock source, turn on the Enable user-supplied start-up clock (CLKUSR) option in the Quartus II software from the General panel of the Device and Pin Options dialog box.

# Table 61. Document Revision History (Part 2 of 3)

Date	Version	Changes		
		Added the I3YY speed grade and changed the data rates for the GX channel in Table 1.		
		<ul> <li>Added the I3YY speed grade to the V<sub>CC</sub> description in Table 6.</li> </ul>		
		<ul> <li>Added the I3YY speed grade to V<sub>CCHIP_L</sub>, V<sub>CCHIP_R</sub>, V<sub>CCHSSI_L</sub>, and V<sub>CCHSSI_R</sub> descriptions in Table 7.</li> </ul>		
		■ Added 240-Ω to Table 11.		
		Changed CDR PPM tolerance in Table 23.		
		<ul> <li>Added additional max data rate for fPLL in Table 23.</li> </ul>		
		<ul> <li>Added the I3YY speed grade and changed the data rates for transceiver speed grade 3 in Table 25.</li> </ul>		
		<ul> <li>Added the I3YY speed grade and changed the data rates for transceiver speed grade 3 in Table 26.</li> </ul>		
		Changed CDR PPM tolerance in Table 28.		
		<ul> <li>Added additional max data rate for fPLL in Table 28.</li> </ul>		
		Changed the mode descriptions for MLAB and M20K in Table 33.		
		• Changed the Max value of f <sub>HSCLK_OUT</sub> for the C2, C2L, I2, I2L speed grades in Table 36.		
November 2014	3.3	<ul> <li>Changed the frequency ranges for C1 and C2 in Table 39.</li> </ul>		
		Changed the .rbf file sizes for 5SGSD6 and 5SGSD8 in Table 47.		
		<ul> <li>Added note about nSTATUS to Table 50, Table 51, Table 54.</li> </ul>
