### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Table 5 lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% of the duty cycle. For example, a signal that overshoots to 3.95 V can be at 3.95 V for only ~21% over the lifetime of the device; for a device lifetime of 10 years, the overshoot duration amounts to ~2 years.

		Fast POR	200 $\mu$ s	—	4 ms	—

**Notes to Table 6:**

- (1)  $V_{CCPD}$  must be 2.5 V when  $V_{CCIO}$  is 2.5, 1.8, 1.5, 1.35, 1.25 or 1.2 V.  $V_{CCPD}$  must be 3.0 V when  $V_{CCIO}$  is 3.0 V.
- (2) If you do not use the design security feature in Stratix V devices, connect  $V_{CCBAT}$  to a 1.2- to 3.0-V power supply. Stratix V power-on-reset (POR) circuitry monitors  $V_{CCBAT}$ . Stratix V devices will not exit POR if  $V_{CCBAT}$  stays at logic low.
- (3) C2L and I2L can also be run at 0.90 V for legacy boards that were designed for the C2 and I2 speed grades.
- (4) The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

**Table 40. DQS Phase Offset Delay Per Setting for Stratix V Devices (1), (2) (Part 2 of 2)**

Speed Grade	Min	Max	Unit
C4,I4	8	16	ps

**Notes to Table 40:**

- (1) The typical value equals the average of the minimum and maximum values.
- (2) The delay settings are linear with a cumulative delay variation of 40 ps for all speed grades. For example, when using a -2 speed grade and applying a 10-phase offset setting to a 90° phase shift at 400 MHz, the expected average cumulative delay is [625 ps + (10 × 10 ps) ± 20 ps] = 725 ps ± 20 ps.

Table 41 lists the DQS phase shift error for Stratix V devices.

**Table 41. DQS Phase Shift Error Specification for DLL-Delayed Clock ( $t_{DQS\_PSERR}$ ) for Stratix V Devices (1)**

2	56	56	60	64	ps
3	84	84	90	96	ps
4	112	112	120	128	ps

**Notes to Table 41:**

- (1) This error specification is the absolute maximum and minimum error. For example, skew on three DQS delay buffers in a -2 speed grade is ±78 ps or ±39 ps.

**Notes to Table 50:**

- (1) Use these timing parameters when the decompression and design security features are disabled.
- (2) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (3) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.
- (4) The minimum and maximum numbers apply only if you chose the internal oscillator as the clock source for initializing the device.
- (5) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.
- (6) If nSTATUS is monitored, follow the  $t_{ST2CK}$  specification. If nSTATUS is not monitored, follow the  $t_{CF2CK}$  specification.

### FPP Configuration Timing when DCLK-to-DATA [] > 1

Figure 13 shows the timing waveform for FPP configuration when using a MAX II device, MAX V device, or microprocessor as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is more than 1.

## Active Serial Configuration Timing

Table 52 lists the DCLK frequency specification in the AS configuration scheme.

**Table 52. DCLK Frequency Specification in the AS Configuration Scheme<sup>(1), (2)</sup>**

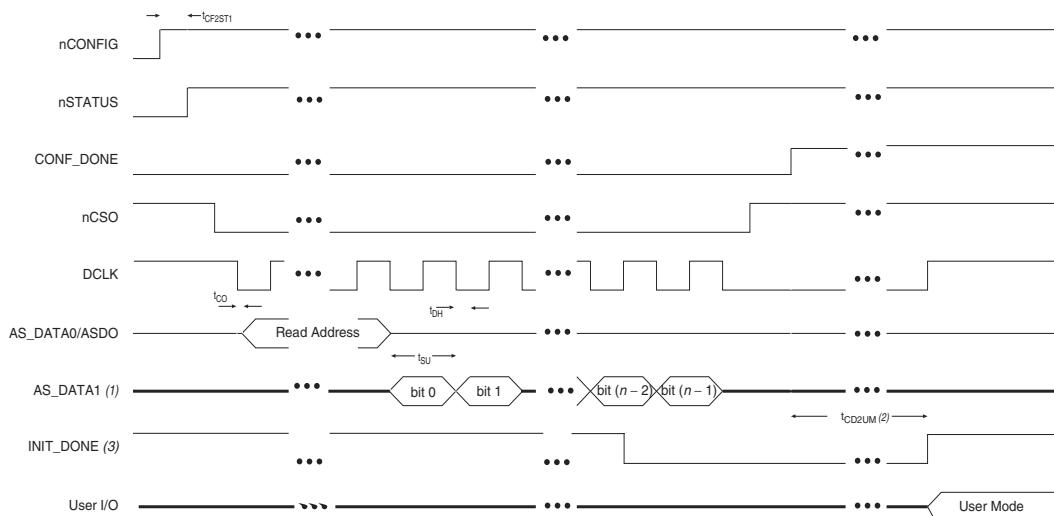

Minimum	Typical	Maximum	Unit
5.3	7.9	12.5	MHz
10.6	15.7	25.0	MHz
21.3	31.4	50.0	MHz
42.6	62.9	100.0	MHz

**Notes to Table 52:**

- (1) This applies to the DCLK frequency specification when using the internal oscillator as the configuration clock source.
- (2) The AS multi-device configuration scheme does not support DCLK frequency of 100 MHz.

Figure 14 shows the single-device configuration setup for an AS ×1 mode.

**Figure 14. AS Configuration Timing**

**Notes to Figure 14:**

- (1) If you are using AS ×4 mode, this signal represents the AS\_DATA [3..0] and EPCQ sends in 4-bits of data for each DCLK cycle.
- (2) The initialization clock can be from internal oscillator or CLKUSR pin.
- (3) After the option bit to enable the INIT\_DONE pin is configured into the device, the INIT\_DONE goes low.

Table 53 lists the timing parameters for AS ×1 and AS ×4 configurations in Stratix V devices.

**Table 53. AS Timing Parameters for AS ×1 and AS ×4 Configurations in Stratix V Devices<sup>(1), (2)</sup> (Part 1 of 2)**
