Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Table 6. Recommended Operating Conditions for Stratix V Devices (Part 2 of 2)

Symbol	Description	Condition	Min ⁽⁴⁾	Typ	Max ⁽⁴⁾	Unit
t _{RAMP}	Power supply ramp time	Standard POR	200 μ s	—	100 ms	—
		Fast POR	200 μ s	—	4 ms	—

Notes to Table 6:

- (1) V_{CCPD} must be 2.5 V when V_{CCIO} is 2.5, 1.8, 1.5, 1.35, 1.25 or 1.2 V. V_{CCPD} must be 3.0 V when V_{CCIO} is 3.0 V.
- (2) If you do not use the design security feature in Stratix V devices, connect V_{CCBAT} to a 1.2- to 3.0-V power supply. Stratix V power-on-reset (POR) circuitry monitors V_{CCBAT}. Stratix V devices will not exit POR if V_{CCBAT} stays at logic low.
- (3) C2L and I2L can also be run at 0.90 V for legacy boards that were designed for the C2 and I2 speed grades.
- (4) The power supply value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

Table 7 lists the transceiver power supply recommended operating conditions for Stratix V GX, GS, and GT devices.

-  You typically use the interactive Excel-based Early Power Estimator before designing the FPGA to get a magnitude estimate of the device power. The Quartus II PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yields very accurate power estimates.

 -  For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

Notes to Table 33:

- (1) To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL set to **50%** output duty cycle. Use the Quartus II software to report timing for this and other memory block clocking schemes.
- (2) When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in F_{MAX}.
- (3) The F_{MAX} specification is only achievable with Fitter options, **MLAB Implementation In 16-Bit Deep Mode** enabled.

Configuration Specification

POR Delay Specification

Power-on reset (POR) delay is defined as the delay between the time when all the power supplies monitored by the POR circuitry reach the minimum recommended operating voltage to the time when the nSTATUS is released high and your device is ready to begin configuration.

For more information about the POR delay, refer to the *Hot Socketing and Power-On Reset in Stratix V Devices* chapter.

Table 45 lists the fast and standard POR delay specification.

Table 45. Fast and Standard POR Delay Specification ⁽¹⁾

POR Delay	Minimum	Maximum
Fast	4 ms	12 ms
Standard	100 ms	300 ms

Note to Table 45:

(1) You can select the POR delay based on the MSEL settings as described in the MSEL Pin Settings section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.

	5SEEB	—	342,742,976	700,888

Notes to Table 47:

- (1) Stratix V E devices do not have PCI Express® (PCIe®) hard IP. Stratix V E devices do not support the CvP configuration scheme.
- (2) 36-transceiver devices.
- (3) 24-transceiver devices.
- (4) File size for the periphery image.
- (5) The IOCSR .rbf size is specifically for the CvP feature.

Use the data in Table 47 to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal (.hex) or tabular text file (.tff) format, have different file sizes. For the different types of configuration file and file sizes, refer to the Quartus II software. However, for a specific version of the Quartus II software, any design targeted for the same device has the same uncompressed configuration file size. If you are using compression, the file size can vary after each compilation because the compression ratio depends on your design.

For more information about setting device configuration options, refer to *Configuration, Design Security, and Remote System Upgrades in Stratix V Devices*. For creating configuration files, refer to the *Quartus II Help*.

FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is 1.

Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 ^{(1), (2)}

Notes to Figure 12:

- (1) Use this timing waveform when the DCLK-to-DATA [] ratio is 1.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (4) After power-up, before and during configuration, CONF_DONE is low.
- (5) Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
- (6) For FPP ×16, use DATA [15..0]. For FPP ×8, use DATA [7..0]. DATA [31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.
- (7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF_DONE is released high when the Stratix V device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (8) After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.

Table 50 lists the timing parameters for Stratix V devices for FPP configuration when the DCLK-to-DATA [] ratio is 1.

- (3) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.
