### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Table 5 lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% of the duty cycle. For example, a signal that overshoots to 3.95 V can be at 3.95 V for only ~21% over the lifetime of the device; for a device lifetime of 10 years, the overshoot duration amounts to ~2 years.

- (4) For optimized LVPECL receiver performance, the receiver voltage input range must be between 0.85 V to 1.75 V for data rate above 700 Mbps and 0.45 V to 1.95 V for data rate below 700 Mbps.
- (5) There are no fixed V<sub>ICM</sub>, V<sub>OD</sub>, and V<sub>OCM</sub> specifications for BLVDS. They depend on the system topology.
- (6) RL range: 90 ≤ RL ≤ 110 Ω.
- (7) The 1.4-V and 1.5-V PCML transceiver I/O standard specifications are described in “Transceiver Performance Specifications” on page 18.

**Notes to Table 23:**

- (1) Speed grades shown in Table 23 refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.
- (2) The reference clock common mode voltage is equal to the  $V_{CCR\_GXB}$  power supply level.
- (3) This supply must be connected to 1.0 V if the transceiver is configured at a data rate > 6.5 Gbps, and to 1.05 V if configured at a data rate > 10.3 Gbps when DFE is used. For data rates up to 6.5 Gbps, you can connect this supply to 0.85 V.
- (4) This supply follows  $V_{CCR\_GXB}$ .
- (5) The device cannot tolerate prolonged operation at this absolute maximum.
- (6) The differential eye opening specification at the receiver input pins assumes that **Receiver Equalization** is disabled. If you enable **Receiver Equalization**, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (7) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.
- (8) The input reference clock frequency options depend on the data rate and the device speed grade.
- (9) The line data rate may be limited by PCS-FPGA interface speed grade.
- (10) Refer to Figure 1 for the GX channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (11)  $t_{LTR}$  is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (12)  $t_{LTD}$  is time required for the receiver CDR to start recovering valid data after the  $rx\_is\_lockedtodata$  signal goes high.
- (13)  $t_{LTD\_manual}$  is the time required for the receiver CDR to start recovering valid data after the  $rx\_is\_lockedtodata$  signal goes high when the CDR is functioning in the manual mode.
- (14)  $t_{LTR\_LTD\_manual}$  is the time the receiver CDR must be kept in lock to reference (LTR) mode after the  $rx\_is\_lockedtoref$  signal goes high when the CDR is functioning in the manual mode.
- (15)  $t_{pll\_powerdown}$  is the PLL powerdown minimum pulse width.
- (16)  $t_{pll\_lock}$  is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (17) To calculate the REFCLK rms phase jitter requirement for PCIe at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f(MHz) = REFCLK rms phase jitter at 100 MHz  $\times$  100/f.
- (18) The maximum peak to peak differential input voltage  $V_{ID}$  after device configuration is equal to  $4 \times (\text{absolute } V_{MAX} \text{ for receiver pin} - V_{ICM})$ .
- (19) For ES devices,  $R_{REF}$  is  $2000 \Omega \pm 1\%$ .
- (20) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at f(MHz) = REFCLK phase noise at 622 MHz +  $20 \times \log(f/622)$ .
- (21) SFP/+ optical modules require the host interface to have RD+/- differentially terminated with  $100 \Omega$ . The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (22) Refer to Figure 2.
- (23) For oversampling designs to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (24) I3YY devices can achieve data rates up to 10.3125 Gbps.
- (25) When you use fPLL as a TXPLL of the transceiver.
- (26) REFCLK performance requires to meet transmitter REFCLK phase noise specification.
- (27) Minimum eye opening of 85 mV is only for the unstressed input eye condition.

Table 24 shows the maximum transmitter data rate for the clock network.

**Notes to Table 24:**

- (1) Valid data rates below the maximum specified in this table depend on the reference clock frequency and the PLL counter settings. Check the MegaWizard message during the PHY IP instantiation.
- (2) ATX PLL is recommended at 8 Gbps and above data rates for improved jitter performance.
- (3) Channel span is within a transceiver bank.
- (4) Side-wide channel bonding is allowed up to the maximum supported by the PHY IP.

- (2) The Phase Compensation FIFO can be configured in FIFO mode or register mode. In the FIFO mode, the pointers are not fixed, and the latency can vary. In the register mode the pointers are fixed for low latency.
- (3) The maximum data rate is also constrained by the transceiver speed grade. Refer to Table 1 for the transceiver speed grade.

- (2) The delay settings are linear with a cumulative delay variation of 40 ps for all speed grades. For example, when using a -2 speed grade and applying a 10-phase offset setting to a 90° phase shift at 400 MHz, the expected average cumulative delay is  $[625 \text{ ps} + (10 \times 10 \text{ ps}) \pm 20 \text{ ps}] = 725 \text{ ps} \pm 20 \text{ ps}$ .

Table 41 lists the DQS phase shift error for Stratix V devices.

- (1) This error specification is the absolute maximum and minimum error. For example, skew on three DQS delay buffers in a -2 speed grade is  $\pm 78 \text{ ps}$  or  $\pm 39 \text{ ps}$ .

Table 42 lists the memory output clock jitter specifications for Stratix V devices.

**Table 46. JTAG Timing Parameters and Values for Stratix V Devices**

Symbol	Description	Min	Max	Unit
$t_{JPH}$	JTAG port hold time	5	—	ns
$t_{JPCO}$	JTAG port clock to output	—	11 <sup>(1)</sup>	ns
$t_{JPZX}$	JTAG port high impedance to valid output	—	14 <sup>(1)</sup>	ns
$t_{JPXZ}$	JTAG port valid output to high impedance	—	14 <sup>(1)</sup>	ns

**Notes to Table 46:**

- (1) A 1 ns adder is required for each  $V_{CCIO}$  voltage step down from 3.0 V. For example,  $t_{JPCO}$  = 12 ns if  $V_{CCIO}$  of the TDO I/O bank = 2.5 V, or 13 ns if it equals 1.8 V.
- (2) The minimum TCK clock period is 167 ns if VCCBAT is within the range 1.2V-1.5V when you perform the volatile key programming.

## Raw Binary File Size

For the POR delay specification, refer to the “POR Delay Specification” section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices”.

Table 47 lists the uncompressed raw binary file (.rbf) sizes for Stratix V devices.

- (1) You can set this value in the Quartus II software by selecting **D1**, **D2**, **D3**, **D5**, and **D6** in the **Assignment Name** column of **Assignment Editor**.
- (2) Minimum offset does not include the intrinsic delay.

## Programmable Output Buffer Delay

Table 59 lists the delay chain settings that control the rising and falling edge delays of the output buffer. The default delay is 0 ps.

**Table 59. Programmable Output Buffer Delay for Stratix V Devices (1)**

Symbol	Parameter	Typical	Unit
D <sub>OUTBUF</sub>	Rising and/or falling edge delay	0 (default)	ps
		25	ps
		50	ps
		75	ps

**Note to Table 59:**

- (1) You can set the programmable output buffer delay in the Quartus II software by setting the **Output Buffer Delay Control** assignment to either positive, negative, or both edges, with the specific values stated here (in ps) for the **Output Buffer Delay** assignment.
