Understanding <u>Embedded - FPGAs (Field Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Calibration accuracy for the calibrated series and parallel OCTs are applicable at the moment of calibration. When voltage and temperature conditions change after calibration, the tolerance may change.

OCT calibration is automatically performed at power-up for OCT-enabled I/Os. Table 13 lists the OCT variation with temperature and voltage after power-up calibration. Use Table 13 to determine the OCT variation after power-up calibration and Equation 1 to determine the OCT variation without recalibration.

Equation 1. OCT Variation Without Recalibration for Stratix V Devices (1), (2), (3), (4), (5), (6)

$$R_{OCT} = R_{SCAL} \Big(1 + \langle \frac{dR}{dT} \times \Delta T \rangle \pm \langle \frac{dR}{dV} \times \Delta V \rangle \Big)$$

Notes to Equation 1:

- (1) The R_{OCT} value shows the range of OCT resistance with the variation of temperature and V_{CCIO} .
- (2) R_{SCAL} is the OCT resistance value at power-up.
- (3) ΔT is the variation of temperature with respect to the temperature at power-up.
- (4) ΔV is the variation of voltage with respect to the V_{CCIO} at power-up.
- (5) dR/dT is the percentage change of R_{SCAL} with temperature.
- (6) dR/dV is the percentage change of R_{SCAL} with voltage.

Table 13 lists the on-chip termination variation after power-up calibration.

	pull-up resistor option.	1.35 ±5%	25	kΩ
		1.25 ±5%	25	kΩ
		1.2 ±5%	25	kΩ

Notes to Table 16:

- (1) All I/O pins have an option to enable the weak pull-up resistor except the configuration, test, and JTAG pins.
- (2) The internal weak pull-down feature is only available for the JTAG TCK pin. The typical value for this internal weak pull-down resistor is approximately 25 k Ω .
- (3) The pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO} .
- (4) These specifications are valid with a ±10% tolerance to cover changes over PVT.

I/O Standard Specifications

Table 17 through Table 22 list the input voltage (V_{IH} and V_{IL}), output voltage (V_{OH} and V_{OL}), and current drive characteristics (I_{OH} and I_{OL}) for various I/O standards supported by Stratix V devices. These tables also show the Stratix V device family I/O standard specifications. The V_{OL} and V_{OH} values are valid at the corresponding I_{OH} and I_{OL} , respectively.

For an explanation of the terms used in Table 17 through Table 22, refer to "Glossary" on page 65. For tolerance calculations across all SSTL and HSTL I/O standards, refer to Altera knowledge base solution rd07262012_486.

Notes to Table 22:

- (1) For optimized LVDS receiver performance, the receiver voltage input range must be between 1.0 V to 1.6 V for data rates above 700 Mbps, and 0 V to 1.85 V for data rates below 700 Mbps.
- (2) For optimized RSDS receiver performance, the receiver voltage input range must be between 0.25 V to 1.45 V.
- (3) For optimized Mini-LVDS receiver performance, the receiver voltage input range must be between 0.3 V to 1.425 V.
- (4) For optimized LVPECL receiver performance, the receiver voltage input range must be between 0.85 V to 1.75 V for data rate above 700 Mbps and 0.45 V to 1.95 V for data rate below 700 Mbps.
- (5) There are no fixed V_{ICM} , V_{OD} , and V_{OCM} specifications for BLVDS. They depend on the system topology.
- (6) RL range: $90 \le RL \le 110 \Omega$.
- (7) The 1.4-V and 1.5-V PCML transceiver I/O standard specifications are described in "Transceiver Performance Specifications" on page 18.
- (8) The minimum VID value is applicable over the entire common mode range, VCM.
- (9) LVPECL is only supported on dedicated clock input pins.
- (10) Differential inputs are powered by VCCPD which requires 2.5 $\rm V.$

Power Consumption

Altera offers two ways to estimate power consumption for a design—the Excel-based Early Power Estimator and the Quartus[®] II PowerPlay Power Analyzer feature.

Switching Characteristics

This section provides performance characteristics of the Stratix V core and periphery blocks.

These characteristics can be designated as Preliminary or Final.

- Preliminary characteristics are created using simulation results, process data, and other known parameters. The title of these tables show the designation as "Preliminary."
- Final numbers are based on actual silicon characterization and testing. The numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. There are no designations on finalized tables.

Transceiver Performance Specifications

This section describes transceiver performance specifications.

Notes to Table 23:

- (1) Speed grades shown in Table 23 refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.
- (2) The reference clock common mode voltage is equal to the V_{CCR_GXB} power supply level.
- (3) This supply must be connected to 1.0 V if the transceiver is configured at a data rate > 6.5 Gbps, and to 1.05 V if configured at a data rate > 10.3 Gbps when DFE is used. For data rates up to 6.5 Gbps, you can connect this supply to 0.85 V.
- (4) This supply follows VCCR_GXB.
- (5) The device cannot tolerate prolonged operation at this absolute maximum.
- (6) The differential eye opening specification at the receiver input pins assumes that **Receiver Equalization** is disabled. If you enable **Receiver Equalization**, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (7) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.
- (8) The input reference clock frequency options depend on the data rate and the device speed grade.
- (9) The line data rate may be limited by PCS-FPGA interface speed grade.
- (10) Refer to Figure 1 for the GX channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (11) t_{LTR} is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (12) t_{I TD} is time required for the receiver CDR to start recovering valid data after the rx_is_lockedtodata signal goes high.
- (13) t_{LTD_manual} is the time required for the receiver CDR to start recovering valid data after the rx_is_lockedtodata signal goes high when the CDR is functioning in the manual mode.
- (14) t_{LTR_LTD_manual} is the time the receiver CDR must be kept in lock to reference (LTR) mode after the rx_is_lockedtoref signal goes high when the CDR is functioning in the manual mode.
- (15) $t_{pll\ powerdown}$ is the PLL powerdown minimum pulse width.
- (16) t_{nll lock} is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (17) To calculate the REFCLK rms phase jitter requirement for PCle at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f(MHz) = REFCLK rms phase jitter at 100 MHz × 100/f.
- (18) The maximum peak to peak differential input voltage V_{ID} after device configuration is equal to 4 × (absolute V_{MAX} for receiver pin V_{ICM}).
- (19) For ES devices, R_{REF} is 2000 Ω ±1%.
- (20) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at f(MHz) = REFCLK phase noise at 622 MHz + 20*log(f/622).
- (21) SFP/+ optical modules require the host interface to have RD+/- differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (22) Refer to Figure 2.
- (23) For oversampling designs to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (24) I3YY devices can achieve data rates up to 10.3125 Gbps.
- (25) When you use fPLL as a TXPLL of the transceiver.
- (26) REFCLK performance requires to meet transmitter REFCLK phase noise specification.
- (27) Minimum eye opening of 85 mV is only for the unstressed input eye condition.

Notes to Table 36:

- (1) When J = 3 to 10, use the serializer/deserializer (SERDES) block.
- (2) When J = 1 or 2, bypass the SERDES block.
- (3) This only applies to DPA and soft-CDR modes.
- (4) Clock Boost Factor (W) is the ratio between the input data rate to the input clock rate.
- (5) This is achieved by using the **LVDS** clock network.
- (6) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.
- (7) The maximum ideal frequency is the SERDES factor (J) x the PLL maximum output frequency (fOUT) provided you can close the design timing and the signal integrity simulation is clean.
- (8) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and receiver sampling margin to determine the maximum data rate supported.
- (9) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.
- (10) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.
- (11) The F_{MAX} specification is based on the fast clock used for serial data. The interface F_{MAX} is also dependent on the parallel clock domain which is design-dependent and requires timing analysis.
- (12) Stratix V RX LVDS will need DPA. For Stratix V TX LVDS, the receiver side component must have DPA.
- (13) Stratix V LVDS serialization and de-serialization factor needs to be x4 and above.
- (14) Requires package skew compensation with PCB trace length.
- (15) Do not mix single-ended I/O buffer within LVDS I/O bank.
- (16) Chip-to-chip communication only with a maximum load of 5 pF.
- (17) When using True LVDS RX channels for emulated LVDS TX channel, only serialization factors 1 and 2 are supported.

Table 40. DQS Phase Offset Delay Per Setting for Stratix V Devices (1), (2) (Part 2 of 2)

Speed Grade	Min	Max	Unit
C4,I4	8	16	ps

Notes to Table 40:

- (1) The typical value equals the average of the minimum and maximum values.
- (2) The delay settings are linear with a cumulative delay variation of 40 ps for all speed grades. For example, when using a -2 speed grade and applying a 10-phase offset setting to a 90° phase shift at 400 MHz, the expected average cumulative delay is [625 ps + (10 × 10 ps) ± 20 ps] = 725 ps ± 20 ps.

Table 41 lists the DQS phase shift error for Stratix V devices.

POR Delay Specification

Power-on reset (POR) delay is defined as the delay between the time when all the power supplies monitored by the POR circuitry reach the minimum recommended operating voltage to the time when the nSTATUS is released high and your device is ready to begin configuration.

For more information about the POR delay, refer to the *Hot Socketing and Power-On Reset in Stratix V Devices* chapter.

Table 45 lists the fast and standard POR delay specification.

POR Delay	Minimum	Maximum
Fast	4 ms	12 ms
Standard	100 ms	300 ms

⁽¹⁾ The DCD numbers do not cover the core clock network.

⁽¹⁾ You can select the POR delay based on the MSEL settings as described in the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

Page 56 Configuration Specification

Table 49. DCLK-to-DATA[] Ratio (1) (Part 2 of 2)

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio	
FPP ×32	Disabled	Disabled	1	
	Disabled	Enabled	4	
	Enabled	Disabled	8	
	Enabled	Enabled	8	

Note to Table 49:

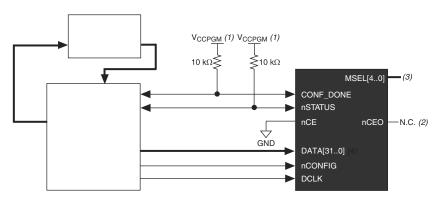

(1) Depending on the DCLK-to-DATA [] ratio, the host must send a DCLK frequency that is r times the data rate in bytes per second (Bps), or words per second (Wps). For example, in FPP ×16 when the DCLK-to-DATA [] ratio is 2, the DCLK frequency must be 2 times the data rate in Wps. Stratix V devices use the additional clock cycles to decrypt and decompress the configuration data.

If the DCLK-to-DATA[] ratio is greater than 1, at the end of configuration, you can only stop the DCLK (DCLK-to-DATA[] ratio -1) clock cycles after the last data is latched into the Stratix V device.

Figure 11 shows the configuration interface connections between the Stratix V device and a MAX II or MAX V device for single device configuration.

Figure 11. Single Device FPP Configuration Using an External Host

Notes to Figure 11:

- (1) Connect the resistor to a supply that provides an acceptable input signal for the Stratix V device. V_{CCPGM} must be high enough to meet the V_{IH} specification of the I/O on the device and the external host. Altera recommends powering up all configuration system I/Os with V_{CCPGM}.
- (2) You can leave the nceo pin unconnected or use it as a user I/O pin when it does not feed another device's nce pin.
- (3) The MSEL pin settings vary for different data width, configuration voltage standards, and POR delay. To connect MSEL, refer to the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.
- (4) If you use FPP $\times 8$, use DATA [7..0]. If you use FPP $\times 16$, use DATA [15..0].

Configuration Specification Page 57

FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the DCLK-to-DATA[] ratio is 1.

Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 (1), (2)

Notes to Figure 12:

- (1) Use this timing waveform when the DCLK-to-DATA[] ratio is 1.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (4) After power-up, before and during configuration, CONF DONE is low.
- (5) Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
- (6) For FPP ×16, use DATA [15..0]. For FPP ×8, use DATA [7..0]. DATA [31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.
- (7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF_DONE is released high when the Stratix V device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (8) After the option bit to enable the <code>INIT_DONE</code> pin is configured into the device, the <code>INIT_DONE</code> goes low.

Active Serial Configuration Timing

Table 52 lists the DCLK frequency specification in the AS configuration scheme.

Table 52. DCLK Frequency Specification in the AS Configuration Scheme (1), (2)

10.6	15.7	25.0	MHz
21.3	31.4	50.0	MHz
42.6	62.9	100.0	MHz

Notes to Table 52:

- (1) This applies to the DCLK frequency specification when using the internal oscillator as the configuration clock source.
- (2) The AS multi-device configuration scheme does not support DCLK frequency of 100 MHz.

Figure 14 shows the single-device configuration setup for an AS ×1 mode.

Figure 14. AS Configuration Timing

Notes to Figure 14:

- (1) If you are using AS ×4 mode, this signal represents the AS_DATA [3..0] and EPCQ sends in 4-bits of data for each DCLK cycle.
- (2) The initialization clock can be from internal oscillator or ${\tt CLKUSR}$ pin.
- (3) After the option bit to enable the $INIT_DONE$ pin is configured into the device, the $INIT_DONE$ goes low.

Table 53 lists the timing parameters for AS $\times 1$ and AS $\times 4$ configurations in Stratix V devices.
