### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

**Absolute Maximum Ratings**

Absolute maximum ratings define the maximum operating conditions for Stratix V devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

Conditions other than those listed in Table 3 may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

**Table 3. Absolute Maximum Ratings for Stratix V Devices (Part 1 of 2)**

Table 5 lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% of the duty cycle. For example, a signal that overshoots to 3.95 V can be at 3.95 V for only ~21% over the lifetime of the device; for a device lifetime of 10 years, the overshoot duration amounts to ~2 years.

**Notes to Table 25:**

- (1) The maximum data rate is in Gbps.
- (2) The Phase Compensation FIFO can be configured in FIFO mode or register mode. In the FIFO mode, the pointers are not fixed, and the latency can vary. In the register mode the pointers are fixed for low latency.
- (3) The maximum data rate is also constrained by the transceiver speed grade. Refer to Table 1 for the transceiver speed grade.

Figure 2 shows the differential transmitter output waveform.

**Figure 2. Differential Transmitter Output Waveform**

Figure 3 shows the Stratix V AC gain curves for GX channels.

**Figure 3. AC Gain Curves for GX Channels (full bandwidth)**

Stratix V GT devices contain both GX and GT channels. All transceiver specifications for the GX channels not listed in Table 28 are the same as those listed in Table 23.

Table 28 lists the Stratix V GT transceiver specifications.

**Table 31. PLL Specifications for Stratix V Devices (Part 3 of 3)**

Symbol	Parameter	Min	Typ	Max	Unit
$f_{RES}$	Resolution of VCO frequency ( $f_{INPFD} = 100$ MHz)	390625	5.96	0.023	Hz

**Notes to Table 31:**

- (1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.
- (2) This specification is limited by the lower of the two: I/O  $f_{MAX}$  or  $f_{OUT}$  of the PLL.
- (3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source < 120 ps.
- (4)  $f_{REF}$  is  $f_{IN}/N$  when  $N = 1$ .
- (5) Peak-to-peak jitter with a probability level of  $10^{-12}$  (14 sigma, 99.9999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 44 on page 52.
- (6) The cascaded PLL specification is only applicable with the following condition:
  - a. Upstream PLL:  $0.59\text{MHz} \leq \text{Upstream PLL BW} < 1$  MHz
  - b. Downstream PLL: Downstream PLL BW > 2 MHz
- (7) High bandwidth PLL settings are not supported in external feedback mode.
- (8) The external memory interface clock output jitter specifications use a different measurement method, which is available in Table 42 on page 50.
- (9) The VCO frequency reported by the Quartus II software in the PLL Usage Summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the  $f_{VCO}$  specification.
- (10) This specification only covers fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.05 - 0.95 must be  $\geq 1000$  MHz, while  $f_{VCO}$  for fractional value range 0.20 - 0.80 must be  $\geq 1200$  MHz.
- (11) This specification only covered fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.05-0.95 must be  $\geq 1000$  MHz.
- (12) This specification only covered fractional PLL for low bandwidth. The  $f_{VCO}$  for fractional value range 0.20-0.80 must be  $\geq 1200$  MHz.

## Periphery Performance

This section describes periphery performance, including high-speed I/O and external memory interface.

I/O performance supports several system interfaces, such as the **LVDS** high-speed I/O interface, external memory interface, and the **PCI/PCI-X** bus interface.

General-purpose I/O standards such as 3.3-, 2.5-, 1.8-, and 1.5-**LVTTL/LVCMOS** are capable of a typical 167 MHz and 1.2-**LVCMOS** at 100 MHz interfacing frequency with a 10 pF load.

The actual achievable frequency depends on design- and system-specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

**Notes to Table 36:**

- (1) When J = 3 to 10, use the serializer/deserializer (SERDES) block.
- (2) When J = 1 or 2, bypass the SERDES block.
- (3) This only applies to DPA and soft-CDR modes.
- (4) Clock Boost Factor (W) is the ratio between the input data rate to the input clock rate.
- (5) This is achieved by using the **LVDS** clock network.
- (6) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.
- (7) The maximum ideal frequency is the SERDES factor (J) x the PLL maximum output frequency (f<sub>OUT</sub>) provided you can close the design timing and the signal integrity simulation is clean.
- (8) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and receiver sampling margin to determine the maximum data rate supported.
- (9) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.
- (10) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.
- (11) The F<sub>MAX</sub> specification is based on the fast clock used for serial data. The interface F<sub>MAX</sub> is also dependent on the parallel clock domain which is design-dependent and requires timing analysis.
- (12) Stratix V RX LVDS will need DPA. For Stratix V TX LVDS, the receiver side component must have DPA.
- (13) Stratix V LVDS serialization and de-serialization factor needs to be x4 and above.
- (14) Requires package skew compensation with PCB trace length.
- (15) Do not mix single-ended I/O buffer within LVDS I/O bank.
- (16) Chip-to-chip communication only with a maximum load of 5 pF.
- (17) When using True LVDS RX channels for emulated LVDS TX channel, only serialization factors 1 and 2 are supported.

## Configuration Specification

### POR Delay Specification

Power-on reset (POR) delay is defined as the delay between the time when all the power supplies monitored by the POR circuitry reach the minimum recommended operating voltage to the time when the nSTATUS is released high and your device is ready to begin configuration.

For more information about the POR delay, refer to the *Hot Socketing and Power-On Reset in Stratix V Devices* chapter.

Table 45 lists the fast and standard POR delay specification.

**Table 45. Fast and Standard POR Delay Specification <sup>(1)</sup>**

POR Delay	Minimum	Maximum
Fast	4 ms	12 ms
Standard	100 ms	300 ms

**Note to Table 45:**

(1) You can select the POR delay based on the MSEL settings as described in the MSEL Pin Settings section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.

## Fast Passive Parallel Configuration Timing

This section describes the fast passive parallel (FPP) configuration timing parameters for Stratix V devices.

### DCLK-to-DATA[] Ratio for FPP Configuration

FPP configuration requires a different DCLK-to-DATA [] ratio when you enable the design security, decompression, or both features. Table 49 lists the DCLK-to-DATA [] ratio for each combination.

**Table 49. DCLK-to-DATA[] Ratio <sup>(1)</sup> (Part 1 of 2)**

FPP ×16	Disabled	Disabled	1

## FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is 1.

**Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 <sup>(1)</sup>, <sup>(2)</sup>**

### Notes to Figure 12:

- (1) Use this timing waveform when the DCLK-to-DATA [] ratio is 1.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF\_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (4) After power-up, before and during configuration, CONF\_DONE is low.
- (5) Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.
- (6) For FPP x16, use DATA [15..0]. For FPP x8, use DATA [7..0]. DATA [31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.
- (7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF\_DONE is released high when the Stratix V device receives all the configuration data successfully. After CONF\_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (8) After the option bit to enable the INIT\_DONE pin is configured into the device, the INIT\_DONE goes low.

Table 51 lists the timing parameters for Stratix V devices for FPP configuration when the DCLK-to-DATA [ ] ratio is more than 1.

$t_{CD2UMC}$	CONF_DONE high to user mode with CLKUSR option on	$t_{CD2CU} + (8576 \times \text{CLKUSR period})$ <sup>(4)</sup>	—	—

**Notes to Table 51:**

- (1) Use these timing parameters when you use the decompression and design security features.
- (2) You can obtain this value if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (3) The minimum and maximum numbers apply only if you use the internal oscillator as the clock source for initializing the device.
- (4) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.
- (5) N is the DCLK-to-DATA ratio and  $f_{DCLK}$  is the DCLK frequency the system is operating.
- (6) If nSTATUS is monitored, follow the  $t_{ST2CK}$  specification. If nSTATUS is not monitored, follow the  $t_{CF2CK}$  specification.

- (3) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on this pin, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.

## Passive Serial Configuration Timing

Figure 15 shows the timing waveform for a passive serial (PS) configuration when using a MAX II device, MAX V device, or microprocessor as an external host.

**Figure 15. PS Configuration Timing Waveform <sup>(1)</sup>****Notes to Figure 15:**

- (1) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF\_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (2) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (3) After power-up, before and during configuration, CONF\_DONE is low.
- (4) Do not leave DCLK floating after configuration. You can drive it high or low, whichever is more convenient.
- (5) DATA0 is available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings in the **Device and Pins Option**.
- (6) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF\_DONE is released high after the Stratix V device receives all the configuration data successfully. After CONF\_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (7) After the option bit to enable the INIT\_DONE pin is configured into the device, the INIT\_DONE goes low.
