Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Table 1. Stratix V GX and GS Commercial and Industrial Speed Grade Offering [1], [2], [3] **(Part 2 of 2)**

Transceiver Speed Grade	Core Speed Grade							
	C1	C2, C2L	C3	C4	I2, I2L	I3, I3L	I3YY	I4
3 GX channel—8.5 Gbps	—	Yes	Yes	Yes	—	Yes	Yes [4]	Yes

Notes to Table 1:

(1) C = Commercial temperature grade; I = Industrial temperature grade.

(2) Lower number refers to faster speed grade.

(3) C2L, I2L, and I3L speed grades are for low-power devices.

(4) I3YY speed grades can achieve up to 10.3125 Gbps.

Table 2 lists the industrial and commercial speed grades for the Stratix V GT devices.

Table 2. Stratix V GT Commercial and Industrial Speed Grade Offering [1], [2]

Transceiver Speed Grade	Core Speed Grade			
	C1	C2	I2	I3
2 GX channel—12.5 Gbps GT channel—28.05 Gbps	Yes	Yes	—	—
3 GX channel—12.5 Gbps GT channel—25.78 Gbps	Yes	Yes	Yes	Yes

Notes to Table 2:

(1) C = Commercial temperature grade; I = Industrial temperature grade.

(2) Lower number refers to faster speed grade.

Absolute Maximum Ratings

Absolute maximum ratings define the maximum operating conditions for Stratix V devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

⚠ CAUTION Conditions other than those listed in Table 3 may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

Table 3. Absolute Maximum Ratings for Stratix V Devices (Part 1 of 2)

Symbol	Description	Minimum	Maximum	Unit
V_{CC}	Power supply for core voltage and periphery circuitry	−0.5	1.35	V
V_{CCPT}	Power supply for programmable power technology	−0.5	1.8	V
V_{CCPGM}	Power supply for configuration pins	−0.5	3.9	V
V_{CC_AUX}	Auxiliary supply for the programmable power technology	−0.5	3.4	V
V_{CCBAT}	Battery back-up power supply for design security volatile key register	−0.5	3.9	V
V_{CCPD}	I/O pre-driver power supply	−0.5	3.9	V
V_{CCIO}	I/O power supply	−0.5	3.9	V

V_{CCH_GXBR}	Transmitter output buffer power supply (right side)	GX, GS, GT	1.425	1.5	1.575	V

Notes to Table 7:

(1) This supply must be connected to 3.0 V if the CMU PLL, receiver CDR, or both, are configured at a base data rate > 6.5 Gbps. Up to 6.5 Gbps, you can connect this supply to either 3.0 V or 2.5 V.

(2) Refer to Table 8 to select the correct power supply level for your design.

(3) When using ATX PLLs, the supply must be 3.0 V.

(4) This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

I/O Pin Leakage Current

Table 9 lists the Stratix V I/O pin leakage current specifications.

Table 9. I/O Pin Leakage Current for Stratix V Devices [1]

Symbol	Description	Conditions	Min	Typ	Max	Unit
I_I	Input pin	V_I = 0 V to $V_{CCIOMAX}$	−30	—	30	μA
I_{OZ}	Tri-stated I/O pin	V_O = 0 V to $V_{CCIOMAX}$	−30	—	30	μA

Note to Table 9:

(1) If V_O = V_{CCIO} to $V_{CCIOMax}$, 100 μA of leakage current per I/O is expected.

Bus Hold Specifications

Table 10 lists the Stratix V device family bus hold specifications.

Table 10. Bus Hold Parameters for Stratix V Devices

On-Chip Termination (OCT) Specifications

If you enable OCT calibration, calibration is automatically performed at power-up for I/Os connected to the calibration block. Table 11 lists the Stratix V OCT termination calibration accuracy specifications.

Table 11. OCT Calibration Accuracy Specifications for Stratix V Devices [1] **(Part 1 of 2)**

Symbol	Description	Conditions	Calibration Accuracy				Unit
			C1	C2,I2	C3,I3, I3YY	C4,I4

☞ You typically use the interactive Excel-based Early Power Estimator before designing the FPGA to get a magnitude estimate of the device power. The Quartus II PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yields very accurate power estimates.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

Notes to Table 25:

(1)   The maximum data rate is in Gbps.

(2)   The Phase Compensation FIFO can be configured in FIFO mode or register mode. In the FIFO mode, the pointers are not fixed, and the latency can vary. In the register mode the pointers are fixed for low latency.

(3)   The maximum data rate is also constrained by the transceiver speed grade. Refer to Table 1 for the transceiver speed grade.

☞ Stratix V GT devices contain both GX and GT channels. All transceiver specifications for the GX channels not listed in Table 28 are the same as those listed in Table 23.

Table 28 lists the Stratix V GT transceiver specifications.

Table 28. Transceiver Specifications for Stratix V GT Devices (Part 5 of 5) [1]

		Min	Typ	Max	Min	Typ	Max	
t_{pll_lock} [14]	—	—	—	10	—	—	10	µs

Notes to Table 28:

(1) Speed grades shown refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.

(2) The reference clock common mode voltage is equal to the VCCR_GXB power supply level.

(3) The device cannot tolerate prolonged operation at this absolute maximum.

(4) The differential eye opening specification at the receiver input pins assumes that receiver equalization is disabled. If you enable receiver equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.

(5) Refer to Figure 5 for the GT channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.

(6) Refer to Figure 6 for the GT channel DC gain curves.

(7) CFP2 optical modules require the host interface to have the receiver data pins differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.

(8) Specifications for this parameter are the same as for Stratix V GX and GS devices. See Table 23 for specifications.

(9) t_{LTR} is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.

(10) t_{LTD} is time required for the receiver CDR to start recovering valid data after the `rx_is_lockedtodata` signal goes high.

(11) t_{LTD_manual} is the time required for the receiver CDR to start recovering valid data after the `rx_is_lockedtodata` signal goes high when the CDR is functioning in the manual mode.

(12) $t_{LTR\_LTD\_manual}$ is the time the receiver CDR must be kept in lock to reference (LTR) mode after the `rx_is_lockedtoref` signal goes high when the CDR is functioning in the manual mode.

(13) `tpll_powerdown` is the PLL powerdown minimum pulse width.

(14) `tpll_lock` is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.

(15) To calculate the REFCLK rms phase jitter requirement for PCIe at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f(MHz) = REFCLK rms phase jitter at 100 MHz × 100/f.

(16) The maximum peak to peak differential input voltage V_{ID} after device configuration is equal to 4 × (absolute V_{MAX} for receiver pin - V_{ICM}).

(17) For ES devices, RREF is 2000 Ω ±1%.

(18) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at f(MHz) = REFCLK phase noise at 622 MHz + 20*log(f/622).

(19) SFP/+ optical modules require the host interface to have RD+/- differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.

(20) Refer to Figure 4.

(21) For oversampling design to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.

(22) This supply follows VCCR_GXB for both GX and GT channels.

(23) When you use fPLL as a TXPLL of the transceiver.

Table 29 shows the V_{OD} settings for the GT channel.

Table 29. Typical V_{OD} Setting for GT Channel, TX Termination = 100 Ω

Symbol	V_{OD} Setting	V_{OD} Value (mV)

Core Performance Specifications

This section describes the clock tree, phase-locked loop (PLL), digital signal processing (DSP), memory blocks, configuration, and JTAG specifications.

Clock Tree Specifications

Table 30 lists the clock tree specifications for Stratix V devices.

Table 30. Clock Tree Performance for Stratix V Devices [1]

Symbol	Performance			Unit
	C1, C2, C2L, I2, and I2L	C3, I3, I3L, and I3YY	C4, I4	
Global and Regional Clock	717	650	580	MHz
Periphery Clock	550	500	500	MHz

Note to Table 30:

(1) The Stratix V ES devices are limited to 600 MHz core clock tree performance.

Table 31. PLL Specifications for Stratix V Devices (Part 3 of 3)

Symbol	Parameter	Min	Typ	Max	Unit
f$_{RES}$	Resolution of VCO frequency (f$_{INPFD}$ = 100 MHz)	390625	5.96	0.023	Hz

Notes to Table 31:

(1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.

(2) This specification is limited by the lower of the two: I/O f$_{MAX}$ or f$_{OUT}$ of the PLL.

(3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source < 120 ps.

(4) f$_{REF}$ is fIN/N when N = 1.

(5) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.99999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 44 on page 52.

(6) The cascaded PLL specification is only applicable with the following condition:
a. Upstream PLL: 0.59Mhz ≤ Upstream PLL BW < 1 MHz
b. Downstream PLL: Downstream PLL BW > 2 MHz

(7) High bandwidth PLL settings are not supported in external feedback mode.

(8) The external memory interface clock output jitter specifications use a different measurement method, which is available in Table 42 on page 50.

(9) The VCO frequency reported by the Quartus II software in the PLL Usage Summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the f$_{VCO}$ specification.

(10) This specification only covers fractional PLL for low bandwidth. The f$_{VCO}$ for fractional value range 0.05 - 0.95 must be ≥ 1000 MHz, while f$_{VCO}$ for fractional value range 0.20 - 0.80 must be ≥ 1200 MHz.

(11) This specification only covered fractional PLL for low bandwidth. The f$_{VCO}$ for fractional value range 0.05-0.95 must be ≥ 1000 MHz.

(12) This specification only covered fractional PLL for low bandwidth. The f$_{VCO}$ for fractional value range 0.20-0.80 must be ≥ 1200 MHz.

	ROM, all supported widths	0	1	700	700	650	550	700	500	450	MHz

Notes to Table 33:

(1) To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL set to **50%** output duty cycle. Use the Quartus II software to report timing for this and other memory block clocking schemes.

(2) When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in F_{MAX}.

(3) The F_{MAX} specification is only achievable with Fitter options, **MLAB Implementation In 16-Bit Deep Mode** enabled.

DLL Range, DQS Logic Block, and Memory Output Clock Jitter Specifications

Table 39 lists the DLL range specification for Stratix V devices. The DLL is always in 8-tap mode in Stratix V devices.

Table 39. DLL Range Specifications for Stratix V Devices [1]

C1	C2, C2L, I2, I2L	C3, I3, I3L, I3YY	C4,I4	Unit
300-933	300-933	300-890	300-890	MHz

Note to Table 39:

(1) Stratix V devices support memory interface frequencies lower than 300 MHz, although the reference clock that feeds the DLL must be at least 300 MHz. To support interfaces below 300 MHz, multiply the reference clock feeding the DLL to ensure the frequency is within the supported range of the DLL.

Table 40 lists the DQS phase offset delay per stage for Stratix V devices.

Table 47. Uncompressed .rbf Sizes for Stratix V Devices

Family	Device	Package	Configuration .rbf Size (bits)	IOCSR .rbf Size (bits) [4], [5]
Stratix V E [1]	5SEE9	—	342,742,976	700,888
	5SEEB	—	342,742,976	700,888

Notes to Table 47:

(1) Stratix V E devices do not have PCI Express® (PCIe®) hard IP. Stratix V E devices do not support the CvP configuration scheme.

(2) 36-transceiver devices.

(3) 24-transceiver devices.

(4) File size for the periphery image.

(5) The IOCSR **.rbf** size is specifically for the CvP feature.

Use the data in Table 47 to estimate the file size before design compilation. Different configuration file formats, such as a hexadecimal (**.hex**) or tabular text file (**.ttf**) format, have different file sizes. For the different types of configuration file and file sizes, refer to the Quartus II software. However, for a specific version of the Quartus II software, any design targeted for the same device has the same uncompressed configuration file size. If you are using compression, the file size can vary after each compilation because the compression ratio depends on your design.

For more information about setting device configuration options, refer to *Configuration, Design Security, and Remote System Upgrades in Stratix V Devices*. For creating configuration files, refer to the *Quartus II Help*.

Table 48 lists the minimum configuration time estimates for Stratix V devices.

Table 49. DCLK-to-DATA[] Ratio *(1)* **(Part 2 of 2)**

| Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×32	Disabled	Disabled	1
	Disabled	Enabled	4
	Enabled	Disabled	8
	Enabled	Enabled	8

Note to Table 49:

(1) Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is r times the data rate in bytes per second (Bps), or words per second (Wps). For example, in FPP ×16 when the DCLK-to-DATA[] ratio is 2, the DCLK frequency must be 2 times the data rate in Wps. Stratix V devices use the additional clock cycles to decrypt and decompress the configuration data.

☞ If the DCLK-to-DATA[] ratio is greater than 1, at the end of configuration, you can only stop the DCLK (DCLK-to-DATA[] ratio – 1) clock cycles after the last data is latched into the Stratix V device.

Figure 11 shows the configuration interface connections between the Stratix V device and a MAX II or MAX V device for single device configuration.

Figure 11. Single Device FPP Configuration Using an External Host
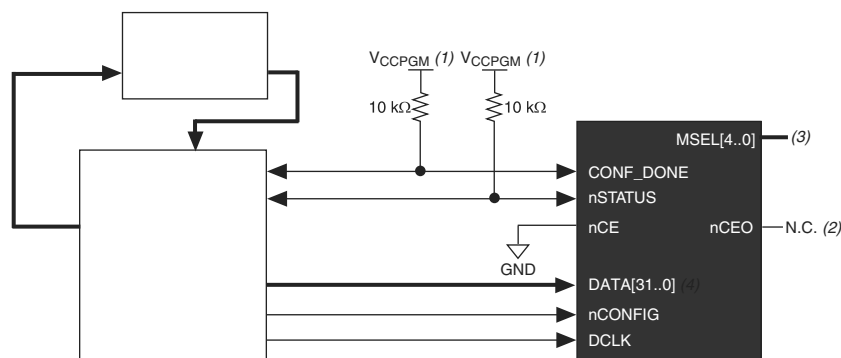

Notes to Figure 11:

(1) Connect the resistor to a supply that provides an acceptable input signal for the Stratix V device. V_{CCPGM} must be high enough to meet the V_{IH} specification of the I/O on the device and the external host. Altera recommends powering up all configuration system I/Os with V_{CCPGM}.

(2) You can leave the nCEO pin unconnected or use it as a user I/O pin when it does not feed another device's nCE pin.

(3) The MSEL pin settings vary for different data width, configuration voltage standards, and POR delay. To connect MSEL, refer to the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

(4) If you use FPP ×8, use DATA[7..0]. If you use FPP ×16, use DATA[15..0].

FPP Configuration Timing when DCLK-to-DATA [] = 1

Figure 12 shows the timing waveform for FPP configuration when using a MAX II or MAX V device as an external host. This waveform shows timing when the DCLK-to-DATA[] ratio is 1.

Figure 12. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is 1 *(1), (2)*
Notes to Figure 12:

(1) Use this timing waveform when the DCLK-to-DATA[] ratio is 1.

(2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic-high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.

(3) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.

(4) After power-up, before and during configuration, CONF_DONE is low.

(5) Do not leave DCLK floating after configuration. DCLK is ignored after configuration is complete. It can toggle high or low if required.

(6) For FPP ×16, use DATA[15..0]. For FPP ×8, use DATA[7..0]. DATA[31..0] are available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings.

(7) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF_DONE is released high when the Stratix V device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.

(8) After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.

Table 54 lists the PS configuration timing parameters for Stratix V devices.

Table 54. PS Timing Parameters for Stratix V Devices

Symbol	Parameter	Minimum	Maximum	Units
t_{CF2CD}	nCONFIG low to CONF_DONE low	—	600	ns
t_{CF2ST0}	nCONFIG low to nSTATUS low	—	600	ns
t_{CFG}	nCONFIG low pulse width	2	—	μs
t_{STATUS}	nSTATUS low pulse width	268	1,506 [1]	μs
t_{CF2ST1}	nCONFIG high to nSTATUS high	—	1,506 [2]	μs
t_{CF2CK} [5]	nCONFIG high to first rising edge on DCLK	1,506	—	μs
t_{ST2CK} [5]	nSTATUS high to first rising edge of DCLK	2	—	μs
t_{DSU}	DATA[] setup time before rising edge on DCLK	5.5	—	ns
t_{DH}	DATA[] hold time after rising edge on DCLK	0	—	ns
t_{CH}	DCLK high time	$0.45 \times 1/f_{MAX}$	—	s
t_{CL}	DCLK low time	$0.45 \times 1/f_{MAX}$	—	s
t_{CLK}	DCLK period	$1/f_{MAX}$	—	s
f_{MAX}	DCLK frequency	—	125	MHz
t_{CD2UM}	CONF_DONE high to user mode [3]	175	437	μs
t_{CD2CU}	CONF_DONE high to CLKUSR enabled	$4 \times$ maximum DCLK period	—	—
t_{CD2UMC}	CONF_DONE high to user mode with CLKUSR option on	t_{CD2CU} + $(8576 \times$ CLKUSR period) [4]	—	—

Notes to Table 54:

(1) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.

(2) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.

(3) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.

(4) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the "Initialization" section.

(5) If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.

Initialization

Table 55 lists the initialization clock source option, the applicable configuration schemes, and the maximum frequency.

Table 55. Initialization Clock Source Option and the Maximum Frequency

Initialization Clock Source	Configuration Schemes	Maximum Frequency	Minimum Number of Clock Cycles [1]
Internal Oscillator	AS, PS, FPP	12.5 MHz	
CLKUSR	AS, PS, FPP [2]	125 MHz	8576
DCLK	PS, FPP	125 MHz	

Notes to Table 55:

(1) The minimum number of clock cycles required for device initialization.

(2) To enable CLKUSR as the initialization clock source, turn on the **Enable user-supplied start-up clock (CLKUSR)** option in the Quartus II software from the **General** panel of the **Device and Pin Options** dialog box.
