### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

- (3) The DPA lock time stated in this table applies to both commercial and industrial grade.
- (4) This is the number of repetitions for the stated training pattern to achieve the 256 data transitions.

Figure 8 shows the LVDS soft-clock data recovery (CDR)/DPA sinusoidal jitter tolerance specification for a data rate  $\geq 1.25$  Gbps. Table 38 lists the LVDS soft-CDR/DPA sinusoidal jitter tolerance specification for a data rate  $\geq 1.25$  Gbps.

**Notes to Table 42:**

- (1) The clock jitter specification applies to the memory output clock pins generated using differential signal-splitter and DDIO circuits clocked by a PLL output routed on a PHY, regional, or global clock network as specified. Altera recommends using PHY clock networks whenever possible.
- (2) The clock jitter specification applies to the memory output clock pins clocked by an integer PLL.
- (3) The memory output clock jitter is applicable when an input jitter of 30 ps peak-to-peak is applied with bit error rate (BER) -12, equivalent to 14 sigma.

(1) DCLK frequency of 100 MHz using external CLKUSR.

(2) Max FPGA FPP bandwidth may exceed bandwidth available from some external storage or control logic.

## Fast Passive Parallel Configuration Timing

This section describes the fast passive parallel (FPP) configuration timing parameters for Stratix V devices.

### DCLK-to-DATA[] Ratio for FPP Configuration

FPP configuration requires a different DCLK-to-DATA [] ratio when you enable the design security, decompression, or both features. Table 49 lists the DCLK-to-DATA [] ratio for each combination.

**Table 49. DCLK-to-DATA[] Ratio <sup>(1)</sup> (Part 1 of 2)**

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×8	Disabled	Disabled	1
	Disabled	Enabled	1
	Enabled	Disabled	2
	Enabled	Enabled	2
FPP ×16	Disabled	Disabled	1
	Disabled	Enabled	2
	Enabled	Disabled	4
	Enabled	Enabled	4

## Active Serial Configuration Timing

Table 52 lists the DCLK frequency specification in the AS configuration scheme.

**Table 52. DCLK Frequency Specification in the AS Configuration Scheme<sup>(1), (2)</sup>**

Minimum	Typical	Maximum	Unit
5.3	7.9	12.5	MHz
10.6	15.7	25.0	MHz
21.3	31.4	50.0	MHz
42.6	62.9	100.0	MHz

**Notes to Table 52:**

- (1) This applies to the DCLK frequency specification when using the internal oscillator as the configuration clock source.
- (2) The AS multi-device configuration scheme does not support DCLK frequency of 100 MHz.

Figure 14 shows the single-device configuration setup for an AS ×1 mode.

**Figure 14. AS Configuration Timing**

**Notes to Figure 14:**

- (1) If you are using AS ×4 mode, this signal represents the AS\_DATA [3..0] and EPCQ sends in 4-bits of data for each DCLK cycle.
- (2) The initialization clock can be from internal oscillator or CLKUSR pin.
- (3) After the option bit to enable the INIT\_DONE pin is configured into the device, the INIT\_DONE goes low.

Table 53 lists the timing parameters for AS ×1 and AS ×4 configurations in Stratix V devices.

**Table 53. AS Timing Parameters for AS ×1 and AS ×4 Configurations in Stratix V Devices<sup>(1), (2)</sup> (Part 1 of 2)**

Symbol	Parameter	Minimum	Maximum	Units
t <sub>CO</sub>	DCLK falling edge to AS_DATA0/ASDO output	—	2	ns
t <sub>SU</sub>	Data setup time before falling edge on DCLK	1.5	—	ns
t <sub>H</sub>	Data hold time after falling edge on DCLK	0	—	ns

**Table 53. AS Timing Parameters for AS ×1 and AS ×4 Configurations in Stratix V Devices<sup>(1), (2)</sup> (Part 2 of 2)**

Symbol	Parameter	Minimum	Maximum	Units
$t_{CD2UM}$	CONF_DONE high to user mode <sup>(3)</sup>	175	437	μs
$t_{CD2CU}$	CONF_DONE high to CLKUSR enabled	4 × maximum DCLK period	—	—
$t_{CD2UMC}$	CONF_DONE high to user mode with CLKUSR option on	$t_{CD2CU} + (8576 \times$ CLKUSR period)	—	—

**Notes to Table 53:**

- (1) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.
- (2)  $t_{CF2CD}$ ,  $t_{CF2STO}$ ,  $t_{CFG}$ ,  $t_{STATUS}$ , and  $t_{CF2ST1}$  timing parameters are identical to the timing parameters for PS mode listed in Table 54 on page 63.
- (3) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on this pin, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.

## Passive Serial Configuration Timing

Figure 15 shows the timing waveform for a passive serial (PS) configuration when using a MAX II device, MAX V device, or microprocessor as an external host.

**Figure 15. PS Configuration Timing Waveform<sup>(1)</sup>****Notes to Figure 15:**

- (1) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF\_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (2) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (3) After power-up, before and during configuration, CONF\_DONE is low.
- (4) Do not leave DCLK floating after configuration. You can drive it high or low, whichever is more convenient.
- (5) DATA0 is available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings in the **Device and Pins Option**.
- (6) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF\_DONE is released high after the Stratix V device receives all the configuration data successfully. After CONF\_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (7) After the option bit to enable the INIT\_DONE pin is configured into the device, the INIT\_DONE goes low.

**Notes to Table 58:**

- (1) You can set this value in the Quartus II software by selecting **D1**, **D2**, **D3**, **D5**, and **D6** in the **Assignment Name** column of **Assignment Editor**.  
(2) Minimum offset does not include the intrinsic delay.

## Programmable Output Buffer Delay

Table 59 lists the delay chain settings that control the rising and falling edge delays of the output buffer. The default delay is 0 ps.

**Table 59. Programmable Output Buffer Delay for Stratix V Devices (1)**

**Note to Table 59:**

- (1) You can set the programmable output buffer delay in the Quartus II software by setting the **Output Buffer Delay Control** assignment to either positive, negative, or both edges, with the specific values stated here (in ps) for the **Output Buffer Delay** assignment.
