### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

**Notes to Table 7:**

- (1) This supply must be connected to 3.0 V if the CMU PLL, receiver CDR, or both, are configured at a base data rate > 6.5 Gbps. Up to 6.5 Gbps, you can connect this supply to either 3.0 V or 2.5 V.
- (2) Refer to Table 8 to select the correct power supply level for your design.
- (3) When using ATX PLLs, the supply must be 3.0 V.
- (4) This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

Table 8 shows the transceiver power supply voltage requirements for various conditions.

## DC Characteristics

This section lists the supply current, I/O pin leakage current, input pin capacitance, on-chip termination tolerance, and hot socketing specifications.

### Supply Current

Supply current is the current drawn from the respective power rails used for power budgeting. Use the Excel-based Early Power Estimator (EPE) to get supply current estimates for your design because these currents vary greatly with the resources you use.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

## Switching Characteristics

This section provides performance characteristics of the Stratix V core and periphery blocks.

These characteristics can be designated as Preliminary or Final.

- Preliminary characteristics are created using simulation results, process data, and other known parameters. The title of these tables show the designation as “Preliminary.”
- Final numbers are based on actual silicon characterization and testing. The numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. There are no designations on finalized tables.

**Notes to Table 28:**

- (1) Speed grades shown refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.
- (2) The reference clock common mode voltage is equal to the VCCR\_GXB power supply level.
- (3) The device cannot tolerate prolonged operation at this absolute maximum.
- (4) The differential eye opening specification at the receiver input pins assumes that receiver equalization is disabled. If you enable receiver equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (5) Refer to Figure 5 for the GT channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (6) Refer to Figure 6 for the GT channel DC gain curves.
- (7) CFP2 optical modules require the host interface to have the receiver data pins differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (8) Specifications for this parameter are the same as for Stratix V GX and GS devices. See Table 23 for specifications.
- (9)  $t_{LTR}$  is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (10)  $t_{LTD}$  is time required for the receiver CDR to start recovering valid data after the  $rx\_is\_lockedto\ data$  signal goes high.
- (11)  $t_{LTD\_manual}$  is the time required for the receiver CDR to start recovering valid data after the  $rx\_is\_lockedto\ data$  signal goes high when the CDR is functioning in the manual mode.
- (12)  $t_{LTR\_LTD\_manual}$  is the time the receiver CDR must be kept in lock to reference (LTR) mode after the  $rx\_is\_lockedto\ ref$  signal goes high when the CDR is functioning in the manual mode.
- (13)  $tp11\_powerdown$  is the PLL powerdown minimum pulse width.
- (14)  $tp11\_lock$  is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (15) To calculate the REFCLK rms phase jitter requirement for PCIe at reference clock frequencies other than 100 MHz, use the following formula:  
REFCLK rms phase jitter at f(MHz) = REFCLK rms phase jitter at 100 MHz × 100/f.
- (16) The maximum peak to peak differential input voltage  $V_{ID}$  after device configuration is equal to  $4 \times (\text{absolute } V_{MAX} \text{ for receiver pin} - V_{ICM})$ .
- (17) For ES devices, RREF is 2000 Ω ±1%.
- (18) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at f(MHz) = REFCLK phase noise at 622 MHz + 20\*log(f/622).
- (19) SFP/+ optical modules require the host interface to have RD+/- differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (20) Refer to Figure 4.
- (21) For oversampling design to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (22) This supply follows VCCR\_GXB for both GX and GT channels.
- (23) When you use fPLL as a TXPLL of the transceiver.

### DLL Range, DQS Logic Block, and Memory Output Clock Jitter Specifications

Table 39 lists the DLL range specification for Stratix V devices. The DLL is always in 8-tap mode in Stratix V devices.

**Table 39. DLL Range Specifications for Stratix V Devices <sup>(1)</sup>**

C1	C2, C2L, I2, I2L	C3, I3, I3L, I3YY	C4,I4	Unit
300-933	300-933	300-890	300-890	MHz

**Note to Table 39:**

- (1) Stratix V devices support memory interface frequencies lower than 300 MHz, although the reference clock that feeds the DLL must be at least 300 MHz. To support interfaces below 300 MHz, multiply the reference clock feeding the DLL to ensure the frequency is within the supported range of the DLL.

Table 40 lists the DQS phase offset delay per stage for Stratix V devices.

**Table 40. DQS Phase Offset Delay Per Setting for Stratix V Devices <sup>(1), (2)</sup> (Part 1 of 2)**

Speed Grade	Min	Max	Unit
C1	8	14	ps
C2, C2L, I2, I2L	8	14	ps
C3,I3, I3L, I3YY	8	15	ps

**Table 49. DCLK-to-DATA[] Ratio <sup>(1)</sup> (Part 2 of 2)**

Configuration Scheme	Decompression	Design Security	DCLK-to-DATA[] Ratio
FPP ×32	Disabled	Disabled	1
	Disabled	Enabled	4
	Enabled	Disabled	8
	Enabled	Enabled	8

**Note to Table 49:**

- (1) Depending on the DCLK-to-DATA[] ratio, the host must send a DCLK frequency that is r times the data rate in bytes per second (Bps), or words per second (Wps). For example, in FPP ×16 when the DCLK-to-DATA[] ratio is 2, the DCLK frequency must be 2 times the data rate in Wps. Stratix V devices use the additional clock cycles to decrypt and decompress the configuration data.

If the DCLK-to-DATA[] ratio is greater than 1, at the end of configuration, you can only stop the DCLK (DCLK-to-DATA[] ratio – 1) clock cycles after the last data is latched into the Stratix V device.

Figure 11 shows the configuration interface connections between the Stratix V device and a MAX II or MAX V device for single device configuration.

**Figure 11. Single Device FPP Configuration Using an External Host****Notes to Figure 11:**

- (1) Connect the resistor to a supply that provides an acceptable input signal for the Stratix V device.  $V_{CCPGM}$  must be high enough to meet the  $V_{IH}$  specification of the I/O on the device and the external host. Altera recommends powering up all configuration system I/Os with  $V_{CCPGM}$ .
- (2) You can leave the nCEO pin unconnected or use it as a user I/O pin when it does not feed another device's nCE pin.
- (3) The MSEL pin settings vary for different data width, configuration voltage standards, and POR delay. To connect MSEL, refer to the MSEL Pin Settings section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.
- (4) If you use FPP ×8, use DATA[7..0]. If you use FPP ×16, use DATA[15..0].

Table 50 lists the timing parameters for Stratix V devices for FPP configuration when the DCLK-to-DATA [] ratio is 1.

**Notes to Table 50:**

- (1) Use these timing parameters when the decompression and design security features are disabled.
- (2) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (3) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.
- (4) The minimum and maximum numbers apply only if you chose the internal oscillator as the clock source for initializing the device.
- (5) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.
- (6) If nSTATUS is monitored, follow the t<sub>ST2CK</sub> specification. If nSTATUS is not monitored, follow the t<sub>CF2CK</sub> specification.
