# Understanding <u>Embedded - FPGAs (Field Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

# **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	185000
Number of Logic Elements/Cells	490000
Total RAM Bits	41984000
Number of I/O	432
Number of Gates	-
Voltage - Supply	0.82V ~ 0.88V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1517-FBGA (40x40)
Supplier Device Package	1517-FBGA (40x40)

#### Notes to Table 1:

- (1) C = Commercial temperature grade; I = Industrial temperature grade.
- (2) Lower number refers to faster speed grade.
- (3) C2L, I2L, and I3L speed grades are for low-power devices.
- (4) I3YY speed grades can achieve up to 10.3125 Gbps.

Table 2 lists the industrial and commercial speed grades for the Stratix V GT devices.

3 GX channel—12.5 Gbps GT channel—25.78 Gbps	Yes	Yes	Yes	Yes						

#### Notes to Table 2:

- (1) C = Commercial temperature grade; I = Industrial temperature grade.
- (2) Lower number refers to faster speed grade.

# **Absolute Maximum Ratings**

Absolute maximum ratings define the maximum operating conditions for Stratix V devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

Conditions other than those listed in Table 3 may cause permanent damage to the device. Additionally, device operation at the absolute maximum ratings for extended periods of time may have adverse effects on the device.

Table 3. Absolute Maximum Ratings for Stratix V Devices (Part 1 of 2)

#### Notes to Table 7:

<sup>(1)</sup> This supply must be connected to 3.0 V if the CMU PLL, receiver CDR, or both, are configured at a base data rate > 6.5 Gbps. Up to 6.5 Gbps, you can connect this supply to either 3.0 V or 2.5 V.

<sup>(2)</sup> Refer to Table 8 to select the correct power supply level for your design.

<sup>(3)</sup> When using ATX PLLs, the supply must be 3.0 V.

<sup>(4)</sup> This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

Page 8 Electrical Characteristics

Table 8 shows the transceiver power supply voltage requirements for various conditions.

**Table 8. Transceiver Power Supply Voltage Requirements** 

Conditions	Core Speed Grade	VCCR_GXB & VCCT_GXB (2)	VCCA_GXB	VCCH_GXB	Unit
If BOTH of the following conditions are true:		4.05			
■ Data rate > 10.3 Gbps.	All	1.05			
■ DFE is used.					
If ANY of the following conditions are true (1):			3.0		
ATX PLL is used.					
■ Data rate > 6.5Gbps.	All	1.0			
■ DFE (data rate ≤ 10.3 Gbps), AEQ, or EyeQ feature is used.				1.5	V
If ALL of the following	C1, C2, I2, and I3YY	0.90	2.5		
conditions are true:  ATX PLL is not used.					
■ Data rate ≤ 6.5Gbps.	C2L, C3, C4, I2L, I3, I3L, and I4	0.85	2.5		
DFE, AEQ, and EyeQ are not used.					

#### Notes to Table 8:

- (1) Choose this power supply voltage requirement option if you plan to upgrade your design later with any of the listed conditions.
- (2) If the VCCR\_GXB and VCCT\_GXB supplies are set to 1.0 V or 1.05 V, they cannot be shared with the VCC core supply. If the VCCR\_GXB and VCCT\_GXB are set to either 0.90 V or 0.85 V, they can be shared with the VCC core supply.

### **DC Characteristics**

This section lists the supply current, I/O pin leakage current, input pin capacitance, on-chip termination tolerance, and hot socketing specifications.

### **Supply Current**

Supply current is the current drawn from the respective power rails used for power budgeting. Use the Excel-based Early Power Estimator (EPE) to get supply current estimates for your design because these currents vary greatly with the resources you use.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

#### Notes to Table 23:

- (1) Speed grades shown in Table 23 refer to the PMA Speed Grade in the device ordering code. The maximum data rate could be restricted by the Core/PCS speed grade. Contact your Altera Sales Representative for the maximum data rate specifications in each speed grade combination offered. For more information about device ordering codes, refer to the *Stratix V Device Overview*.
- (2) The reference clock common mode voltage is equal to the  $V_{CCR\_GXB}$  power supply level.
- (3) This supply must be connected to 1.0 V if the transceiver is configured at a data rate > 6.5 Gbps, and to 1.05 V if configured at a data rate > 10.3 Gbps when DFE is used. For data rates up to 6.5 Gbps, you can connect this supply to 0.85 V.
- (4) This supply follows VCCR\_GXB.
- (5) The device cannot tolerate prolonged operation at this absolute maximum.
- (6) The differential eye opening specification at the receiver input pins assumes that **Receiver Equalization** is disabled. If you enable **Receiver Equalization**, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level.
- (7) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.
- (8) The input reference clock frequency options depend on the data rate and the device speed grade.
- (9) The line data rate may be limited by PCS-FPGA interface speed grade.
- (10) Refer to Figure 1 for the GX channel AC gain curves. The total effective AC gain is the AC gain minus the DC gain.
- (11) t<sub>LTR</sub> is the time required for the receive CDR to lock to the input reference clock frequency after coming out of reset.
- (12) t<sub>I TD</sub> is time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high.
- (13) t<sub>LTD\_manual</sub> is the time required for the receiver CDR to start recovering valid data after the rx\_is\_lockedtodata signal goes high when the CDR is functioning in the manual mode.
- (14) t<sub>LTR\_LTD\_manual</sub> is the time the receiver CDR must be kept in lock to reference (LTR) mode after the rx\_is\_lockedtoref signal goes high when the CDR is functioning in the manual mode.
- (15)  $t_{pll\ powerdown}$  is the PLL powerdown minimum pulse width.
- (16) t<sub>nll lock</sub> is the time required for the transmitter CMU/ATX PLL to lock to the input reference clock frequency after coming out of reset.
- (17) To calculate the REFCLK rms phase jitter requirement for PCle at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f(MHz) = REFCLK rms phase jitter at 100 MHz × 100/f.
- (18) The maximum peak to peak differential input voltage V<sub>ID</sub> after device configuration is equal to 4 × (absolute V<sub>MAX</sub> for receiver pin V<sub>ICM</sub>).
- (19) For ES devices,  $R_{REF}$  is 2000  $\Omega$  ±1%.
- (20) To calculate the REFCLK phase noise requirement at frequencies other than 622 MHz, use the following formula: REFCLK phase noise at f(MHz) = REFCLK phase noise at 622 MHz + 20\*log(f/622).
- (21) SFP/+ optical modules require the host interface to have RD+/- differentially terminated with 100 Ω. The internal OCT feature is available after the Stratix V FPGA configuration is completed. Altera recommends that FPGA configuration is completed before inserting the optical module. Otherwise, minimize unnecessary removal and insertion with unconfigured devices.
- (22) Refer to Figure 2.
- (23) For oversampling designs to support data rates less than the minimum specification, the CDR needs to be in LTR mode only.
- (24) I3YY devices can achieve data rates up to 10.3125 Gbps.
- (25) When you use fPLL as a TXPLL of the transceiver.
- (26) REFCLK performance requires to meet transmitter REFCLK phase noise specification.
- (27) Minimum eye opening of 85 mV is only for the unstressed input eye condition.

### Notes to Table 25:

<sup>(1)</sup> The maximum data rate is in Gbps.

<sup>(2)</sup> The Phase Compensation FIFO can be configured in FIFO mode or register mode. In the FIFO mode, the pointers are not fixed, and the latency can vary. In the register mode the pointers are fixed for low latency.

<sup>(3)</sup> The maximum data rate is also constrained by the transceiver speed grade. Refer to Table 1 for the transceiver speed grade.

<sup>(1)</sup> To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL set to **50%** output duty cycle. Use the Quartus II software to report timing for this and other memory block clocking schemes.

<sup>(2)</sup> When you use the error detection cyclical redundancy check (CRC) feature, there is no degradation in F<sub>MAX</sub>.

<sup>(3)</sup> The F<sub>MAX</sub> specification is only achievable with Fitter options, **MLAB Implementation In 16-Bit Deep Mode** enabled.

Page 44 Switching Characteristics

# **Periphery Performance**

This section describes periphery performance, including high-speed I/O and external memory interface.

I/O performance supports several system interfaces, such as the **LVDS** high-speed I/O interface, external memory interface, and the **PCI/PCI-X** bus interface. General-purpose I/O standards such as 3.3-, 2.5-, 1.8-, and 1.5-**LVTTL/LVCMOS** are capable of a typical 167 MHz and 1.2-**LVCMOS** at 100 MHz interfacing frequency with a 10 pF load.

The actual achievable frequency depends on design- and system-specific factors. Ensure proper timing closure in your design and perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

# **High-Speed I/O Specification**

#### Notes to Table 53:

- (1) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.
- $(2) \quad t_{\text{CF2CD}}, t_{\text{CF2ST0}}, t_{\text{CFG}}, t_{\text{STATUS}}, \text{ and } t_{\text{CF2ST1}} \text{ timing parameters are identical to the timing parameters for PS mode listed in Table 54 on page 63}.$
- (3) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on this pin, refer to the Initialization section of the "Configuration, Design Security, and Remote System Upgrades in Stratix V Devices" chapter.

# **Passive Serial Configuration Timing**

Figure 15 shows the timing waveform for a passive serial (PS) configuration when using a MAX II device, MAX V device, or microprocessor as an external host.

Figure 15. PS Configuration Timing Waveform (1)

#### Notes to Figure 15:

- (1) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF\_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (2) After power-up, the Stratix V device holds nSTATUS low for the time of the POR delay.
- (3) After power-up, before and during configuration, CONF DONE is low.
- (4) Do not leave DCLK floating after configuration. You can drive it high or low, whichever is more convenient.
- (5) DATAO is available as a user I/O pin after configuration. The state of this pin depends on the dual-purpose pin settings in the **Device and Pins Option**.
- (6) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF\_DONE is released high after the Stratix V device receives all the configuration data successfully. After CONF\_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (7) After the option bit to enable the INIT DONE pin is configured into the device, the INIT DONE goes low.

#### Notes to Table 54:

- (1) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (2) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.
- (3) The minimum and maximum numbers apply only if you choose the internal oscillator as the clock source for initializing the device.
- (4) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the "Initialization" section.
- (5) If nSTATUS is monitored, follow the t<sub>ST2CK</sub> specification. If nSTATUS is not monitored, follow the t<sub>CF2CK</sub> specification.

## Initialization

Table 55 lists the initialization clock source option, the applicable configuration schemes, and the maximum frequency.

Table 55. Initialization Clock Source Option and the Maximum Frequency

Letter	Subject	Definitions			
	SW (sampling window)	Timing Diagram—the period of time during which the data must be valid in order to capture it correctly. The setup and hold times determine the ideal strobe position within the sampling window, as shown:  Bit Time  0.5 x TCCS RSKM Sampling Window (SW)  0.5 x TCCS			
S	Single-ended voltage referenced I/O standard	The JEDEC standard for <b>SSTL</b> and <b>HSTL</b> I/O defines both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state.  The new logic state is then maintained as long as the input stays beyond the DC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing:  Single-Ended Voltage Referenced I/O Standard  VIHACO  VIHACO  VILLOCO  V			
	t <sub>C</sub> High-speed receiver and transmitter input and output clock period.				
Т	TCCS (channel- to-channel-skew)	The timing difference between the fastest and slowest output edges, including $t_{\text{CO}}$ variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the <i>Timing Diagram</i> figure under <b>SW</b> in this table).			
		High-speed I/O block—Duty cycle on the high-speed transmitter output clock.			
	t <sub>DUTY</sub>	Timing Unit Interval (TUI)  The timing budget allowed for skew, propagation delays, and the data sampling window.  (TUI = $1/(\text{receiver input clock frequency multiplication factor}) = t_{\text{C}}/w$ )			
	t <sub>FALL</sub>	Signal high-to-low transition time (80-20%)			
	t <sub>INCCJ</sub>	Cycle-to-cycle jitter tolerance on the PLL clock input.			
	t <sub>OUTPJ_IO</sub>	Period jitter on the general purpose I/O driven by a PLL.			
	t <sub>OUTPJ_DC</sub>	Period jitter on the dedicated clock output driven by a PLL.			
	t <sub>RISE</sub>	Signal low-to-high transition time (20-80%)

■ Added "Raw Binary File Size" ■ Added Figure 1, Figure 2, and Figure 3. ■ Updated Table 1, Table 2, Table 3, Table 6, Table 11, Table 22, Table 23, Table Table 30, Table 31, Table 32, Table 35, Table 38, Table 39, Table 40, Table 4 Table 56, and Table 59.	
June 2012  Added Figure 1, Figure 2, and Figure 3.  Updated Table 1, Table 2, Table 3, Table 6, Table 11, Table 22, Table 23, Table 36, Table 36, Table 37, Table 38, Table 39, Table 40, Table 40, Table 56, and Table 59.	
June 2012  Updated Table 1, Table 2, Table 3, Table 6, Table 11, Table 22, Table 23, Table 30, Table 31, Table 32, Table 35, Table 38, Table 39, Table 40, Table 4 Table 56, and Table 59.	
Table 30, Table 31, Table 35, Table 38, Table 39, Table 40, Table 4 Table 56, and Table 59.	
■ Changed title of document to <i>Stratix V Device Datasheet</i> .	
■ Removed document from the Stratix V handbook and made it a separate document	cument.
February 2012 2.3 Updated Table 1–22, Table 1–29, Table 1–31, and Table 1–31.	
December 2011 2.2 ■ Added Table 2–31.	
■ Updated Table 2–28 and Table 2–34.	
■ Added Table 2–2 and Table 2–21 and updated Table 2–5 with information at Stratix V GT devices.	out
November 2011 2.1 Updated Table 2–11, Table 2–13, Table 2–20, and Table 2–25.	
■ Various edits throughout to fix SPRs.	
■ Updated Table 2–4, Table 2–18, Table 2–19, Table 2–21, Table 2–22, Table 2 Table 2–24.	2–23, and
May 2011 2.0 ■ Updated the "DQ Logic Block and Memory Output Clock Jitter Specifications	s" title.
■ Chapter moved to Volume 1.	
■ Minor text edits.	
■ Updated Table 1–2, Table 1–4, Table 1–19, and Table 1–23.	
December 2010 1.1 Converted chapter to the new template.	
■ Minor text edits.	
July 2010 1.0 Initial release.
