Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes to Table 7:

- (1) This supply must be connected to 3.0 V if the CMU PLL, receiver CDR, or both, are configured at a base data rate > 6.5 Gbps. Up to 6.5 Gbps, you can connect this supply to either 3.0 V or 2.5 V.
- (2) Refer to Table 8 to select the correct power supply level for your design.
- (3) When using ATX PLLs, the supply must be 3.0 V.
- (4) This value describes the budget for the DC (static) power supply tolerance and does not include the dynamic tolerance requirements. Refer to the PDN tool for the additional budget for the dynamic tolerance requirements.

Table 12. OCT Without Calibration Resistance Tolerance Specifications for Stratix V Devices (Part 2 of 2)

Symbol	Description	Conditions	Resistance Tolerance				Unit
			C1	C2, I2	C3, I3, I3YY	C4, I4	
50-Ω R _S	Internal series termination without calibration (50-Ω setting)	V _{CCIO} = 1.8 and 1.5 V	±30	±30	±40	±40	%
50-Ω R _S	Internal series termination without calibration (50-Ω setting)	V _{CCIO} = 1.2 V	±35	±35	±50	±50	%
100-Ω R _D	Internal differential termination (100-Ω setting)	V _{CCPD} = 2.5 V	±25	±25	±25	±25	%

Calibration accuracy for the calibrated series and parallel OCTs are applicable at the moment of calibration. When voltage and temperature conditions change after calibration, the tolerance may change.

OCT calibration is automatically performed at power-up for OCT-enabled I/Os. Table 13 lists the OCT variation with temperature and voltage after power-up calibration. Use Table 13 to determine the OCT variation after power-up calibration and Equation 1 to determine the OCT variation without recalibration.

Equation 1. OCT Variation Without Recalibration for Stratix V Devices ^{(1), (2), (3), (4), (5), (6)}

$$R_{OCT} = R_{SCAL} \left(1 + \left\langle \frac{dR}{dT} \times \Delta T \right\rangle \pm \left\langle \frac{dR}{dV} \times \Delta V \right\rangle \right)$$

Notes to Equation 1:

- (1) The R_{OCT} value shows the range of OCT resistance with the variation of temperature and V_{CCIO}.
- (2) R_{SCAL} is the OCT resistance value at power-up.
- (3) ΔT is the variation of temperature with respect to the temperature at power-up.
- (4) ΔV is the variation of voltage with respect to the V_{CCIO} at power-up.
- (5) dR/dT is the percentage change of R_{SCAL} with temperature.
- (6) dR/dV is the percentage change of R_{SCAL} with voltage.

Table 13 lists the on-chip termination variation after power-up calibration.

Switching Characteristics

This section provides performance characteristics of the Stratix V core and periphery blocks.

These characteristics can be designated as Preliminary or Final.

- Preliminary characteristics are created using simulation results, process data, and other known parameters. The title of these tables show the designation as “Preliminary.”
- Final numbers are based on actual silicon characterization and testing. The numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. There are no designations on finalized tables.

Fast Passive Parallel Configuration Timing

This section describes the fast passive parallel (FPP) configuration timing parameters for Stratix V devices.

DCLK-to-DATA[] Ratio for FPP Configuration

FPP configuration requires a different DCLK-to-DATA [] ratio when you enable the design security, decompression, or both features. Table 49 lists the DCLK-to-DATA [] ratio for each combination.

Table 49. DCLK-to-DATA[] Ratio ⁽¹⁾ (Part 1 of 2)

Table 50 lists the timing parameters for Stratix V devices for FPP configuration when the DCLK-to-DATA [] ratio is 1.

Notes to Table 50:

- (1) Use these timing parameters when the decompression and design security features are disabled.
- (2) This value is applicable if you do not delay configuration by extending the nCONFIG or nSTATUS low pulse width.
- (3) This value is applicable if you do not delay configuration by externally holding the nSTATUS low.
- (4) The minimum and maximum numbers apply only if you chose the internal oscillator as the clock source for initializing the device.
- (5) To enable the CLKUSR pin as the initialization clock source and to obtain the maximum frequency specification on these pins, refer to the Initialization section of the “Configuration, Design Security, and Remote System Upgrades in Stratix V Devices” chapter.
- (6) If nSTATUS is monitored, follow the t_{ST2CK} specification. If nSTATUS is not monitored, follow the t_{CF2CK} specification.

FPP Configuration Timing when DCLK-to-DATA [] > 1

Figure 13 shows the timing waveform for FPP configuration when using a MAX II device, MAX V device, or microprocessor as an external host. This waveform shows timing when the DCLK-to-DATA [] ratio is more than 1.

Figure 13. FPP Configuration Timing Waveform When the DCLK-to-DATA[] Ratio is >1 (1), (2)**Notes to Figure 13:**

- (1) Use this timing waveform and parameters when the DCLK-to-DATA [] ratio is >1. To find out the DCLK-to-DATA [] ratio for your system, refer to Table 49 on page 55.
- (2) The beginning of this waveform shows the device in user mode. In user mode, nCONFIG, nSTATUS, and CONF_DONE are at logic high levels. When nCONFIG is pulled low, a reconfiguration cycle begins.
- (3) After power-up, the Stratix V device holds nSTATUS low for the time as specified by the POR delay.
- (4) After power-up, before and during configuration, CONF_DONE is low.
- (5) Do not leave DCLK floating after configuration. You can drive it high or low, whichever is more convenient.
- (6) "r" denotes the DCLK-to-DATA [] ratio. For the DCLK-to-DATA [] ratio based on the decompression and the design security feature enable settings, refer to Table 49 on page 55.
- (7) If needed, pause DCLK by holding it low. When DCLK restarts, the external host must provide data on the DATA [31 . . 0] pins prior to sending the first DCLK rising edge.
- (8) To ensure a successful configuration, send the entire configuration data to the Stratix V device. CONF_DONE is released high after the Stratix V device receives all the configuration data successfully. After CONF_DONE goes high, send two additional falling edges on DCLK to begin initialization and enter user mode.
- (9) After the option bit to enable the INIT_DONE pin is configured into the device, the INIT_DONE goes low.
