

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	32MHz
Connectivity	I <sup>2</sup> C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LCD, POR, PWM, WDT
Number of I/O	25
Program Memory Size	7KB (4K x 14)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 11x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic16lf1933t-i-so">https://www.e-xfl.com/product-detail/microchip-technology/pic16lf1933t-i-so</a>

# PIC16(L)F1933

## 3.2.1.1 STATUS Register

The STATUS register, shown in [Register 3-1](#), contains:

- the arithmetic status of the ALU
- the Reset status

The STATUS register can be the destination for any instruction, like any other register. If the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. Furthermore, the  $\overline{\text{TO}}$  and  $\overline{\text{PD}}$  bits are not writable. Therefore, the result of an instruction with the STATUS register as destination may be different than intended.

For example, `CLRF STATUS` will clear the upper three bits and set the Z bit. This leaves the STATUS register as '000u u1uu' (where u = unchanged).

It is recommended, therefore, that only `BCF`, `BSF`, `SWAPF` and `MOVWF` instructions are used to alter the STATUS register, because these instructions do not affect any Status bits. For other instructions not affecting any Status bits (Refer to [Section 29.0 "Instruction Set Summary"](#)).

**Note 1:** The C and DC bits operate as Borrow and Digit Borrow out bits, respectively, in subtraction.

## 3.3 Register Definitions: Status

**REGISTER 3-1: STATUS: STATUS REGISTER**

U-0	U-0	U-0	R-1/q	R-1/q	R/W-0/u	R/W-0/u	R/W-0/u
—	—	—	$\overline{\text{TO}}$	$\overline{\text{PD}}$	Z	DC <sup>(1)</sup>	C <sup>(1)</sup>
bit 7			bit 0				

### Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

u = Bit is unchanged

x = Bit is unknown

-n/n = Value at POR and BOR/Value at all other Resets

'1' = Bit is set

'0' = Bit is cleared

q = Value depends on condition

bit 7-5 **Unimplemented:** Read as '0'

bit 4  **$\overline{\text{TO}}$ :** Time-Out bit

- 1 = After power-up, `CLRWDT` instruction or `SLEEP` instruction
- 0 = A WDT time-out occurred

bit 3  **$\overline{\text{PD}}$ :** Power-Down bit

- 1 = After power-up or by the `CLRWDT` instruction
- 0 = By execution of the `SLEEP` instruction

bit 2 **Z:** Zero bit

- 1 = The result of an arithmetic or logic operation is zero
- 0 = The result of an arithmetic or logic operation is not zero

bit 1 **DC:** Digit Carry/Digit Borrow bit (`ADDWF`, `ADDLW`, `SUBLW`, `SUBWF` instructions)<sup>(1)</sup>

- 1 = A carry-out from the 4th low-order bit of the result occurred
- 0 = No carry-out from the 4th low-order bit of the result

bit 0 **C:** Carry/Borrow bit<sup>(1)</sup> (`ADDWF`, `ADDLW`, `SUBLW`, `SUBWF` instructions)<sup>(1)</sup>

- 1 = A carry-out from the Most Significant bit of the result occurred
- 0 = No carry-out from the Most Significant bit of the result occurred

**Note 1:** For Borrow, the polarity is reversed. A subtraction is executed by adding the two's complement of the second operand. For rotate (`RRF`, `RLF`) instructions, this bit is loaded with either the high-order or low-order bit of the source register.

## 16.0 TEMPERATURE INDICATOR MODULE

This family of devices is equipped with a temperature circuit designed to measure the operating temperature of the silicon die. The circuit's range of operating temperature falls between -40°C and +85°C. The output is a voltage that is proportional to the device temperature. The output of the temperature indicator is internally connected to the device ADC.

The circuit may be used as a temperature threshold detector or a more accurate temperature indicator, depending on the level of calibration performed. A one-point calibration allows the circuit to indicate a temperature closely surrounding that point. A two-point calibration allows the circuit to sense the entire range of temperature more accurately. Reference Application Note AN1333, "Use and Calibration of the Internal Temperature Indicator" (DS01333) for more details regarding the calibration process.

### 16.1 Circuit Operation

Figure 16-1 shows a simplified block diagram of the temperature circuit. The proportional voltage output is achieved by measuring the forward voltage drop across multiple silicon junctions.

Equation 16-1 describes the output characteristics of the temperature indicator.

#### EQUATION 16-1: V<sub>OUT</sub> RANGES

High Range:  $V_{OUT} = V_{DD} - 4V_T$

Low Range:  $V_{OUT} = V_{DD} - 2V_T$

The temperature sense circuit is integrated with the Fixed Voltage Reference (FVR) module. See Section 14.0 "Fixed Voltage Reference (FVR)" for more information.

The circuit is enabled by setting the TSEN bit of the FVRCON register. When disabled, the circuit draws no current.

The circuit operates in either high or low range. The high range, selected by setting the TSRNG bit of the FVRCON register, provides a wider output voltage. This provides more resolution over the temperature range, but may be less consistent from part to part. This range requires a higher bias voltage to operate and thus, a higher V<sub>DD</sub> is needed.

The low range is selected by clearing the TSRNG bit of the FVRCON register. The low range generates a lower voltage drop and thus, a lower bias voltage is needed to operate the circuit. The low range is provided for low voltage operation.

FIGURE 16-1: TEMPERATURE CIRCUIT DIAGRAM

### 16.2 Minimum Operating V<sub>DD</sub>

When the temperature circuit is operated in low range, the device may be operated at any operating voltage that is within specifications.

When the temperature circuit is operated in high range, the device operating voltage, V<sub>DD</sub>, must be high enough to ensure that the temperature circuit is correctly biased.

Table 16-1 shows the recommended minimum V<sub>DD</sub> vs. range setting.

TABLE 16-1: RECOMMENDED V<sub>DD</sub> VS. RANGE

Min. V <sub>DD</sub> , TSRNG = 1	Min. V <sub>DD</sub> , TSRNG = 0
3.6V	1.8V

### 16.3 Temperature Output

The output of the circuit is measured using the internal Analog-to-Digital Converter. A channel is reserved for the temperature circuit output. Refer to Section 15.0 "Analog-to-Digital Converter (ADC) Module" for detailed information.

### 16.4 ADC Acquisition Time

To ensure accurate temperature measurements, the user must wait at least 200 μs after the ADC input multiplexer is connected to the temperature indicator output before the conversion is performed. In addition, the user must wait 200 μs between sequential conversions of the temperature indicator output.

# PIC16(L)F1933

**FIGURE 18-3: ANALOG INPUT MODEL**

**Legend:**  $C_{PIN}$  = Input Capacitance  
 $I_{LEAKAGE}$  = Leakage Current at the pin due to various junctions  
 $R_{IC}$  = Interconnect Resistance  
 $R_S$  = Source Impedance  
 $V_A$  = Analog Voltage  
 $V_T$  = Threshold Voltage

**Note 1:** See [Section 30.0 "Electrical Specifications"](#).

## REGISTER 24-2: SSPCON1: SSP CONTROL REGISTER 1 (CONTINUED)

bit 3-0      **SSPM<3:0>**: Synchronous Serial Port Mode Select bits

- 1111 = I<sup>2</sup>C Slave mode, 10-bit address with Start and Stop bit interrupts enabled
- 1110 = I<sup>2</sup>C Slave mode, 7-bit address with Start and Stop bit interrupts enabled
- 1101 = Reserved
- 1100 = Reserved
- 1011 = I<sup>2</sup>C firmware controlled Master mode (slave idle)
- 1010 = SPI Master mode, clock = Fosc/(4 \* (SSPADD+1))<sup>(5)</sup>
- 1001 = Reserved
- 1000 = I<sup>2</sup>C Master mode, clock = Fosc / (4 \* (SSPADD+1))<sup>(4)</sup>
- 0111 = I<sup>2</sup>C Slave mode, 10-bit address
- 0110 = I<sup>2</sup>C Slave mode, 7-bit address
- 0101 = SPI Slave mode, clock = SCK pin,  $\overline{SS}$  pin control disabled,  $\overline{SS}$  can be used as I/O pin
- 0100 = SPI Slave mode, clock = SCK pin,  $\overline{SS}$  pin control enabled
- 0011 = SPI Master mode, clock = TMR2 output/2
- 0010 = SPI Master mode, clock = Fosc/64
- 0001 = SPI Master mode, clock = Fosc/16
- 0000 = SPI Master mode, clock = Fosc/4

- Note**
- 1:** In Master mode, the overflow bit is not set since each new reception (and transmission) is initiated by writing to the SSPBUF register.
  - 2:** When enabled, these pins must be properly configured as input or output.
  - 3:** When enabled, the SDA and SCL pins must be configured as inputs.
  - 4:** SSPADD values of 0, 1 or 2 are not supported for I<sup>2</sup>C mode.
  - 5:** SSPADD value of '0' is not supported. Use SSPM = 0000 instead.

FIGURE 25-10: SYNCHRONOUS TRANSMISSION

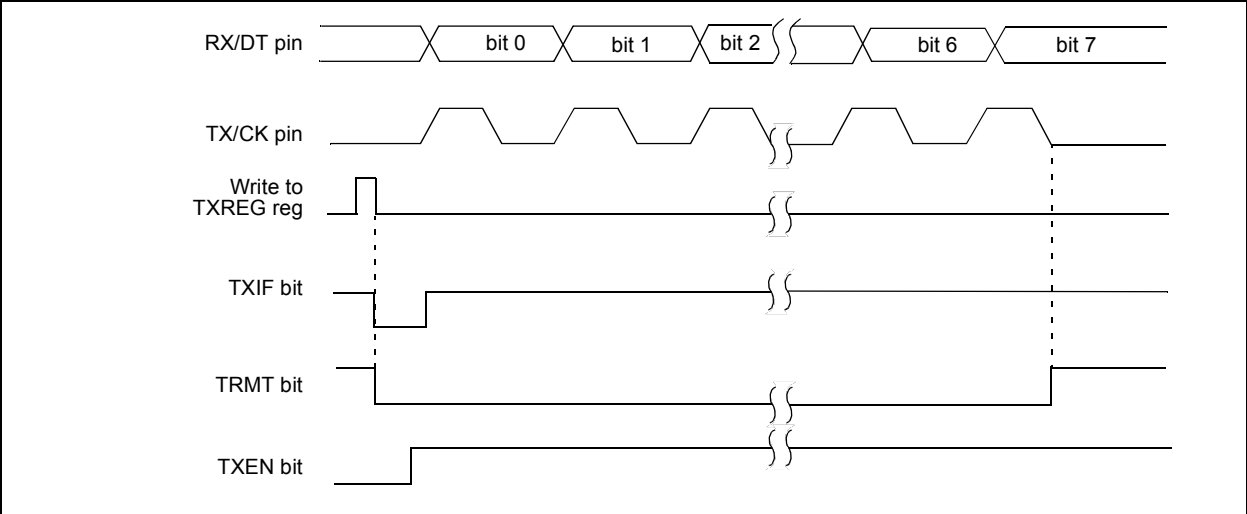

FIGURE 25-11: SYNCHRONOUS TRANSMISSION (THROUGH TXEN)

## 25.5.1.5 Synchronous Master Reception

Data is received at the RX/DT pin. The RX/DT pin output driver is automatically disabled when the EUSART is configured for synchronous master receive operation.

In Synchronous mode, reception is enabled by setting either the Single Receive Enable bit (SREN of the RCSTA register) or the Continuous Receive Enable bit (CREN of the RCSTA register).

When SREN is set and CREN is clear, only as many clock cycles are generated as there are data bits in a single character. The SREN bit is automatically cleared at the completion of one character. When CREN is set, clocks are continuously generated until CREN is cleared. If CREN is cleared in the middle of a character the CK clock stops immediately and the partial character is discarded. If SREN and CREN are both set, then SREN is cleared at the completion of the first character and CREN takes precedence.

To initiate reception, set either SREN or CREN. Data is sampled at the RX/DT pin on the trailing edge of the TX/CK clock pin and is shifted into the Receive Shift Register (RSR). When a complete character is received into the RSR, the RCIF bit is set and the character is automatically transferred to the two character receive FIFO. The Least Significant eight bits of the top character in the receive FIFO are available in RCREG. The RCIF bit remains set as long as there are unread characters in the receive FIFO.

## 25.5.1.6 Slave Clock

Synchronous data transfers use a separate clock line, which is synchronous with the data. A device configured as a slave receives the clock on the TX/CK line. The TX/CK pin output driver is automatically disabled when the device is configured for synchronous slave transmit or receive operation. Serial data bits change on the leading edge to ensure they are valid at the trailing edge of each clock. One data bit is transferred for each clock cycle. Only as many clock cycles should be received as there are data bits.

## 25.5.1.7 Receive Overrun Error

The receive FIFO buffer can hold two characters. An overrun error will be generated if a third character, in its entirety, is received before RCREG is read to access the FIFO. When this happens, the OERR bit of the RCSTA register is set. Previous data in the FIFO will not be overwritten. The two characters in the FIFO buffer can be read, however, no additional characters will be received until the error is cleared. The OERR bit can only be cleared by clearing the overrun condition. If the overrun error occurred when the SREN bit is set and CREN is clear then the error is cleared by reading RCREG. If the overrun occurred when the CREN bit is

set then the error condition is cleared by either clearing the CREN bit of the RCSTA register or by clearing the SPEN bit which resets the EUSART.

## 25.5.1.8 Receiving 9-bit Characters

The EUSART supports 9-bit character reception. When the RX9 bit of the RCSTA register is set the EUSART will shift 9-bits into the RSR for each character received. The RX9D bit of the RCSTA register is the ninth, and Most Significant, data bit of the top unread character in the receive FIFO. When reading 9-bit data from the receive FIFO buffer, the RX9D data bit must be read before reading the eight Least Significant bits from the RCREG.

## 25.5.1.9 Synchronous Master Reception Set-up:

1. Initialize the SPBRGH, SPBRGL register pair for the appropriate baud rate. Set or clear the BRGH and BRG16 bits, as required, to achieve the desired baud rate.
2. Clear the ANSEL bit for the RX pin (if applicable).
3. Enable the synchronous master serial port by setting bits SYNC, SPEN and CSRC.
4. Ensure bits CREN and SREN are clear.
5. If interrupts are desired, set the RCIE bit of the PIE1 register and the GIE and PEIE bits of the INTCON register.
6. If 9-bit reception is desired, set bit RX9.
7. Start reception by setting the SREN bit or for continuous reception, set the CREN bit.
8. Interrupt flag bit RCIF will be set when reception of a character is complete. An interrupt will be generated if the enable bit RCIE was set.
9. Read the RCSTA register to get the ninth bit (if enabled) and determine if any error occurred during reception.
10. Read the 8-bit received data by reading the RCREG register.
11. If an overrun error occurs, clear the error by either clearing the CREN bit of the RCSTA register or by clearing the SPEN bit which resets the EUSART.

## 27.11 LCD Interrupts

The LCD module provides an interrupt in two cases. An interrupt when the LCD controller goes from active to inactive controller. An interrupt also provides unframe boundaries for Type B waveform. The LCD timing generation provides an interrupt that defines the LCD frame timing.

### 27.11.1 LCD INTERRUPT ON MODULE SHUTDOWN

An LCD interrupt is generated when the module completes shutting down (LCDA goes from '1' to '0').

### 27.11.2 LCD FRAME INTERRUPTS

A new frame is defined to begin at the leading edge of the COM0 common signal. The interrupt will be set immediately after the LCD controller completes accessing all pixel data required for a frame. This will occur at a fixed interval before the frame boundary (TFINT), as shown in [Figure 27-19](#). The LCD controller will begin to access data for the next frame within the interval from the interrupt to when the controller begins to access data after the interrupt (TFWR). New data must be written within TFWR, as this is when the LCD controller will begin to access the data for the next frame.

When the LCD driver is running with Type-B waveforms and the LMUX<1:0> bits are not equal to '00' (static drive), there are some additional issues that must be addressed. Since the DC voltage on the pixel takes two frames to maintain zero volts, the pixel data must not change between subsequent frames. If the pixel data were allowed to change, the waveform for the odd frames would not necessarily be the complement of the waveform generated in the even frames and a DC component would be introduced into the panel. Therefore, when using Type-B waveforms, the user must synchronize the LCD pixel updates to occur within a subframe after the frame interrupt.

To correctly sequence writing while in Type-B, the interrupt will only occur on complete phase intervals. If the user attempts to write when the write is disabled, the WERR bit of the LCDCON register is set and the write does not occur.

<p><b>Note:</b> The LCD frame interrupt is not generated when the Type-A waveform is selected and when the Type-B with no multiplex (static) is selected.</p>
---

# PIC16(L)F1933

**FIGURE 27-19: WAVEFORMS AND INTERRUPT TIMING IN QUARTER-DUTY CYCLE DRIVE (EXAMPLE – TYPE-B, NON-STATIC)**

## 27.12 Operation During Sleep

The LCD module can operate during Sleep. The selection is controlled by bit SLPEN of the LCDCON register. Setting the SLPEN bit allows the LCD module to go to Sleep. Clearing the SLPEN bit allows the module to continue to operate during Sleep.

If a **SLEEP** instruction is executed and SLPEN = 1, the LCD module will cease all functions and go into a very low-current consumption mode. The module will stop operation immediately and drive the minimum LCD voltage on both segment and common lines. Figure 27-20 shows this operation.

The LCD module can be configured to operate during Sleep. The selection is controlled by bit SLPEN of the LCDCON register. Clearing SLPEN and correctly configuring the LCD module clock will allow the LCD module to operate during Sleep. Setting SLPEN and correctly executing the LCD module shutdown will disable the LCD module during Sleep and save power.

If a **SLEEP** instruction is executed and SLPEN = 1, the LCD module will immediately cease all functions, drive the outputs to Vss and go into a very low-current mode. The **SLEEP** instruction should only be executed after the LCD module has been disabled and the current cycle completed, thus ensuring that there are no DC voltages on the glass. To disable the LCD module, clear the LCDEN bit. The LCD module will complete the disabling process after the current frame, clear the LCDA bit and optionally cause an interrupt.

The steps required to properly enter Sleep with the LCD disabled are:

- Clear LCDEN
- Wait for LCDA = 0 either by polling or by interrupt
- Execute **SLEEP**

If SLPEN = 0 and **SLEEP** is executed while the LCD module clock source is Fosc/4, then the LCD module will halt with the pin driving the last LCD voltage pattern. Prolonged exposure to a fixed LCD voltage pattern will cause damage to the LCD glass. To prevent LCD glass damage, either perform the proper LCD module shutdown prior to Sleep, or change the LCD module clock to allow the LCD module to continue operation during Sleep.

If a **SLEEP** instruction is executed and SLPEN = 0 and the LCD module clock is either T1OSC or LFINTOSC, the module will continue to display the current contents of the LCDDATA registers. While in Sleep, the LCD data cannot be changed. If the LCDIE bit is set, the device will wake from Sleep on the next LCD frame boundary. The LCD module current consumption will not decrease in this mode; however, the overall device power consumption will be lower due to the shutdown of the CPU and other peripherals.

Table 27-8 shows the status of the LCD module during a Sleep while using each of the three available clock sources.

**Note:** When the LCDEN bit is cleared, the LCD module will be disabled at the completion of frame. At this time, the port pins will revert to digital functionality. To minimize power consumption due to floating digital inputs, the LCD pins should be driven low using the PORT and TRIS registers.

If a **SLEEP** instruction is executed and SLPEN = 0, the module will continue to display the current contents of the LCDDATA registers. To allow the module to continue operation while in Sleep, the clock source must be either the LFINTOSC or T1OSC external oscillator. While in Sleep, the LCD data cannot be changed. The LCD module current consumption will not decrease in this mode; however, the overall consumption of the device will be lower due to shutdown of the core and other peripheral functions.

Table 27-8 shows the status of the LCD module during Sleep while using each of the three available clock sources:

**TABLE 27-8: LCD MODULE STATUS DURING SLEEP**

Clock Source	SLPEN	Operational During Sleep
T1OSC	0	Yes
	1	No
LFINTOSC	0	Yes
	1	No
Fosc/4	0	No
	1	No

**Note:** The LFINTOSC or external T1OSC oscillator must be used to operate the LCD module during Sleep.

If LCD interrupts are being generated (Type-B waveform with a multiplex mode not static) and LCDIE = 1, the device will awaken from Sleep on the next frame boundary.

# PIC16(L)F1933

---

BCF	Bit Clear f
Syntax:	[ <i>label</i> ] BCF f,b
Operands:	$0 \leq f \leq 127$ $0 \leq b \leq 7$
Operation:	$0 \rightarrow (f<b>)$
Status Affected:	None
Description:	Bit 'b' in register 'f' is cleared.

BTFSC	Bit Test f, Skip if Clear
Syntax:	[ <i>label</i> ] BTFSC f,b
Operands:	$0 \leq f \leq 127$ $0 \leq b \leq 7$
Operation:	skip if $(f<b>) = 0$
Status Affected:	None
Description:	If bit 'b' in register 'f' is '1', the next instruction is executed. If bit 'b', in register 'f', is '0', the next instruction is discarded, and a NOP is executed instead, making this a 2-cycle instruction.

BRA	Relative Branch
Syntax:	[ <i>label</i> ] BRA label [ <i>label</i> ] BRA \$+k
Operands:	$-256 \leq \text{label} - \text{PC} + 1 \leq 255$ $-256 \leq k \leq 255$
Operation:	$(\text{PC}) + 1 + k \rightarrow \text{PC}$
Status Affected:	None
Description:	Add the signed 9-bit literal 'k' to the PC. Since the PC will have incremented to fetch the next instruction, the new address will be $\text{PC} + 1 + k$ . This instruction is a two-cycle instruction. This branch has a limited range.

BTFSS	Bit Test f, Skip if Set
Syntax:	[ <i>label</i> ] BTFSS f,b
Operands:	$0 \leq f \leq 127$ $0 \leq b < 7$
Operation:	skip if $(f<b>) = 1$
Status Affected:	None
Description:	If bit 'b' in register 'f' is '0', the next instruction is executed. If bit 'b' is '1', then the next instruction is discarded and a NOP is executed instead, making this a 2-cycle instruction.

BRW	Relative Branch with W
Syntax:	[ <i>label</i> ] BRW
Operands:	None
Operation:	$(\text{PC}) + (W) \rightarrow \text{PC}$
Status Affected:	None
Description:	Add the contents of W (unsigned) to the PC. Since the PC will have incremented to fetch the next instruction, the new address will be $\text{PC} + 1 + (W)$ . This instruction is a two-cycle instruction.

BSF	Bit Set f
Syntax:	[ <i>label</i> ] BSF f,b
Operands:	$0 \leq f \leq 127$ $0 \leq b \leq 7$
Operation:	$1 \rightarrow (f<b>)$
Status Affected:	None
Description:	Bit 'b' in register 'f' is set.

## LSLF Logical Left Shift

**Syntax:** `[label] LSLF f{,d}`

**Operands:**  $0 \leq f \leq 127$   
 $d \in [0,1]$

**Operation:**  $(f<7>) \rightarrow C$   
 $(f<6:0>) \rightarrow \text{dest}<7:1>$   
 $0 \rightarrow \text{dest}<0>$

**Status Affected:** C, Z

**Description:** The contents of register 'f' are shifted one bit to the left through the Carry flag. A '0' is shifted into the LSb. If 'd' is '0', the result is placed in W. If 'd' is '1', the result is stored back in register 'f'.

## LSRF Logical Right Shift

**Syntax:** `[label] LSRF f{,d}`

**Operands:**  $0 \leq f \leq 127$   
 $d \in [0,1]$

**Operation:**  $0 \rightarrow \text{dest}<7>$   
 $(f<7:1>) \rightarrow \text{dest}<6:0>$ ,  
 $(f<0>) \rightarrow C$ ,

**Status Affected:** C, Z

**Description:** The contents of register 'f' are shifted one bit to the right through the Carry flag. A '0' is shifted into the MSb. If 'd' is '0', the result is placed in W. If 'd' is '1', the result is stored back in register 'f'.

## MOVF Move f

**Syntax:** `[label] MOVF f,d`

**Operands:**  $0 \leq f \leq 127$   
 $d \in [0,1]$

**Operation:**  $(f) \rightarrow (\text{dest})$

**Status Affected:** Z

**Description:** The contents of register f is moved to a destination dependent upon the status of d. If d = 0, destination is W register. If d = 1, the destination is file register f itself. d = 1 is useful to test a file register since status flag Z is affected.

**Words:** 1

**Cycles:** 1

**Example:** `MOVF FSR, 0`

After Instruction

W = value in FSR register

Z = 1

# PIC16(L)F1933

---

## **SWAPF**                      **Swap Nibbles in f**

---

Syntax:                      [ *label* ]    SWAPF f,d

Operands:                   $0 \leq f \leq 127$   
                                 $d \in [0,1]$

Operation:                   $(f<3:0>) \rightarrow (\text{destination}<7:4>)$ ,  
                                 $(f<7:4>) \rightarrow (\text{destination}<3:0>)$

Status Affected:          None

Description:                The upper and lower nibbles of register 'f' are exchanged. If 'd' is '0', the result is placed in the W register. If 'd' is '1', the result is placed in register 'f'.

## **XORLW**                      **Exclusive OR literal with W**

---

Syntax:                      [ *label* ]    XORLW k

Operands:                   $0 \leq k \leq 255$

Operation:                   $(W) .XOR. k \rightarrow (W)$

Status Affected:          Z

Description:                The contents of the W register are XOR'ed with the eight-bit literal 'k'. The result is placed in the W register.

## **TRIS**                        **Load TRIS Register with W**

---

Syntax:                      [ *label* ]    TRIS f

Operands:                   $5 \leq f \leq 7$

Operation:                   $(W) \rightarrow \text{TRIS register 'f'}$

Status Affected:          None

Description:                Move data from W register to TRIS register.  
                                When 'f' = 5, TRISA is loaded.  
                                When 'f' = 6, TRISB is loaded.  
                                When 'f' = 7, TRISC is loaded.

## **XORWF**                      **Exclusive OR W with f**

---

Syntax:                      [ *label* ]    XORWF f,d

Operands:                   $0 \leq f \leq 127$   
                                 $d \in [0,1]$

Operation:                   $(W) .XOR. (f) \rightarrow (\text{destination})$

Status Affected:          Z

Description:                Exclusive OR the contents of the W register with register 'f'. If 'd' is '0', the result is stored in the W register. If 'd' is '1', the result is stored back in register 'f'.

PIC16LF1933			Standard Operating Conditions (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for extended				
PIC16F1933			Standard Operating Conditions (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for extended				
Param No.	Device Characteristics	Min.	Typ†	Max.	Units	Conditions	
						VDD	Note
D017	Supply Current (IDD) <sup>(1, 2)</sup>						
		—	130	175	μA	1.8	Fosc = 500 kHz
		—	165	210	μA	3.0	MFINTOSC mode
D017		—	150	200	μA	1.8	Fosc = 500 kHz
		—	210	240	μA	3.0	MFINTOSC mode (Note 5)
		—	270	330	μA	5.0	
D018		—	0.8	1.1	mA	1.8	Fosc = 8 MHz
		—	1.3	1.7	mA	3.0	HFINTOSC mode
D018		—	0.9	1.1	mA	1.8	Fosc = 8 MHz
		—	1.4	1.7	mA	3.0	HFINTOSC mode (Note 5)
		—	1.6	1.8	mA	5.0	
D019		—	1.3	1.7	mA	1.8	Fosc = 16 MHz
		—	2.2	2.6	mA	3.0	HFINTOSC mode
D019		—	1.4	1.6	mA	1.8	Fosc = 16 MHz
		—	2.2	2.6	mA	3.0	HFINTOSC mode (Note 5)
		—	2.4	3.0	mA	5.0	
D020		—	3.9	4.5	mA	3.0	Fosc = 32 MHz
		—	4.7	5.6	mA	3.6	HFINTOSC mode
D020		—	3.9	4.5	mA	3.0	Fosc = 32 MHz
		—	4.1	5.7	mA	5.0	HFINTOSC mode
D021		—	300	350	μA	1.8	Fosc = 4 MHz
		—	500	675	μA	3.0	EXTRC mode (Note 3)
D021		—	350	390	μA	1.8	Fosc = 4 MHz
		—	550	720	μA	3.0	EXTRC mode (Note 3, Note 5)
		—	620	790	μA	5.0	
D022		—	2.7	4.4	mA	3.0	Fosc = 32 MHz
		—	2.9	5.7	mA	3.6	HS Oscillator mode (Note 6)
D022		—	3.6	4.4	mA	3.0	Fosc = 32 MHz
		—	3.9	4.7	mA	5.0	HS Oscillator mode (Note 5, Note 6)

- Note 1:** The test conditions for all IDD measurements in active operation mode are: OSC1 = external square wave, from rail-to-rail; all I/O pins tri-stated, pulled to VDD; MCLR = VDD; WDT disabled.
- Note 2:** The supply current is mainly a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption.
- Note 3:** For RC oscillator configurations, current through REXT is not included. The current through the resistor can be extended by the formula  $I_R = V_{DD}/2R_{EXT}$  (mA) with REXT in kΩ.
- Note 4:** FVR and BOR are disabled.
- Note 5:** 0.1 μF capacitor on VCAP.
- Note 6:** 8 MHz crystal oscillator with 4x PLL enabled.

NOTES:

## 32.0 DEVELOPMENT SUPPORT

The PIC® microcontrollers and dsPIC® digital signal controllers are supported with a full range of software and hardware development tools:

- Integrated Development Environment
  - MPLAB® IDE Software
- Compilers/Assemblers/Linkers
  - MPLAB C Compiler for Various Device Families
  - HI-TECH C® for Various Device Families
  - MPASM™ Assembler
  - MPLINK™ Object Linker/  
MPLIB™ Object Librarian
  - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
  - MPLAB SIM Software Simulator
- Emulators
  - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers
  - MPLAB ICD 3
  - PICKit™ 3 Debug Express
- Device Programmers
  - PICKit™ 2 Programmer
  - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits, and Starter Kits

## 32.1 MPLAB Integrated Development Environment Software

The MPLAB IDE software brings an ease of software development previously unseen in the 8/16/32-bit microcontroller market. The MPLAB IDE is a Windows® operating system-based application that contains:

- A single graphical interface to all debugging tools
  - Simulator
  - Programmer (sold separately)
  - In-Circuit Emulator (sold separately)
  - In-Circuit Debugger (sold separately)
- A full-featured editor with color-coded context
- A multiple project manager
- Customizable data windows with direct edit of contents
- High-level source code debugging
- Mouse over variable inspection
- Drag and drop variables from source to watch windows
- Extensive on-line help
- Integration of select third party tools, such as IAR C Compilers

The MPLAB IDE allows you to:

- Edit your source files (either C or assembly)
- One-touch compile or assemble, and download to emulator and simulator tools (automatically updates all project information)
- Debug using:
  - Source files (C or assembly)
  - Mixed C and assembly
  - Machine code

MPLAB IDE supports multiple debugging tools in a single development paradigm, from the cost-effective simulators, through low-cost in-circuit debuggers, to full-featured emulators. This eliminates the learning curve when upgrading to tools with increased flexibility and power.
