
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	4MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	12
Program Memory Size	768B (512 x 12)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	25 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 6.25V
Data Converters	-
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	18-SOIC (0.295", 7.50mm Width)
Supplier Device Package	18-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16c54-rc-so

3.0 ARCHITECTURAL OVERVIEW

The high performance of the PIC16C5X family can be attributed to a number of architectural features commonly found in RISC microprocessors. To begin with, the PIC16C5X uses a Harvard architecture in which program and data are accessed on separate buses. This improves bandwidth over traditional von Neumann architecture where program and data are fetched on the same bus. Separating program and data memory further allows instructions to be sized differently than the 8-bit wide data word. Instruction opcodes are 12 bits wide making it possible to have all single word instructions. A 12-bit wide program memory access bus fetches a 12-bit instruction in a single cycle. A two-stage pipeline overlaps fetch and execution of instructions. Consequently, all instructions (33) execute in a single cycle except for program branches.

The PIC16C54/CR54 and PIC16C55 address 512 x 12 of program memory, the PIC16C56/CR56 address 1K x 12 of program memory, and the PIC16C57/CR57 and PIC16C58/CR58 address 2K x 12 of program memory. All program memory is internal.

The PIC16C5X can directly or indirectly address its register files and data memory. All special function registers including the program counter are mapped in the data memory. The PIC16C5X has a highly orthogonal (symmetrical) instruction set that makes it possible to carry out any operation on any register using any addressing mode. This symmetrical nature and lack of ‘special optimal situations’ make programming with the PIC16C5X simple yet efficient. In addition, the learning curve is reduced significantly.

The PIC16C5X device contains an 8-bit ALU and working register. The ALU is a general purpose arithmetic unit. It performs arithmetic and Boolean functions between data in the working register and any register file.

The ALU is 8 bits wide and capable of addition, subtraction, shift and logical operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. In two-operand instructions, typically one operand is the W (working) register. The other operand is either a file register or an immediate constant. In single operand instructions, the operand is either the W register or a file register.

The W register is an 8-bit working register used for ALU operations. It is not an addressable register.

Depending on the instruction executed, the ALU may affect the values of the Carry (C), Digit Carry (DC), and Zero (Z) bits in the STATUS register. The C and DC bits operate as a borrow and digit borrow out bit, respectively, in subtraction. See the `SUBWF` and `ADDWF` instructions for examples.

A simplified block diagram is shown in Figure 3-1, with the corresponding device pins described in Table 3-1 (for PIC16C54/56/58) and Table 3-2 (for PIC16C55/57).

FIGURE 5-3: TIME-OUT SEQUENCE ON POWER-UP ($\overline{MCLR}$ NOT TIED TO VDD)

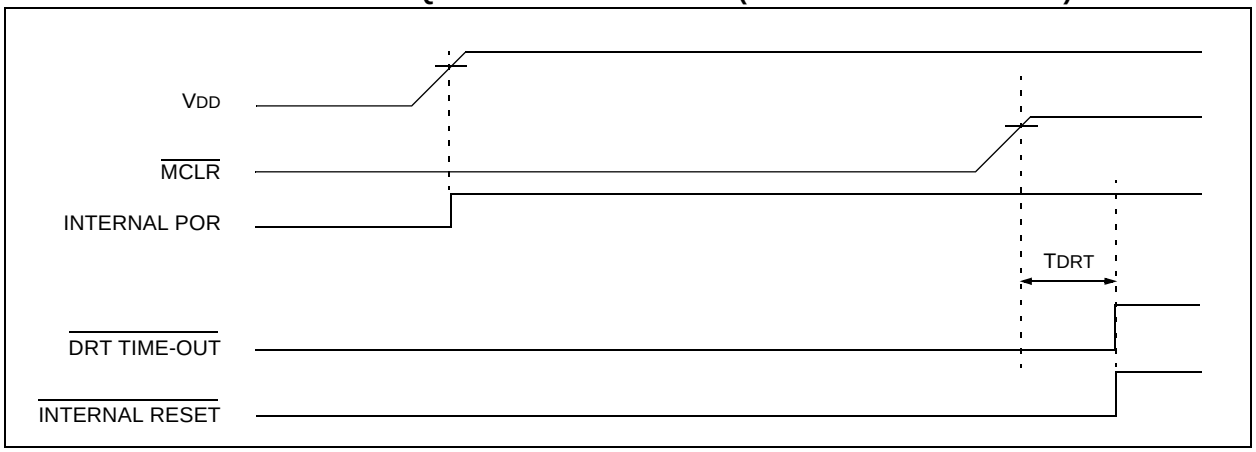

FIGURE 5-4: TIME-OUT SEQUENCE ON POWER-UP ($\overline{MCLR}$ TIED TO VDD): FAST VDD RISE TIME

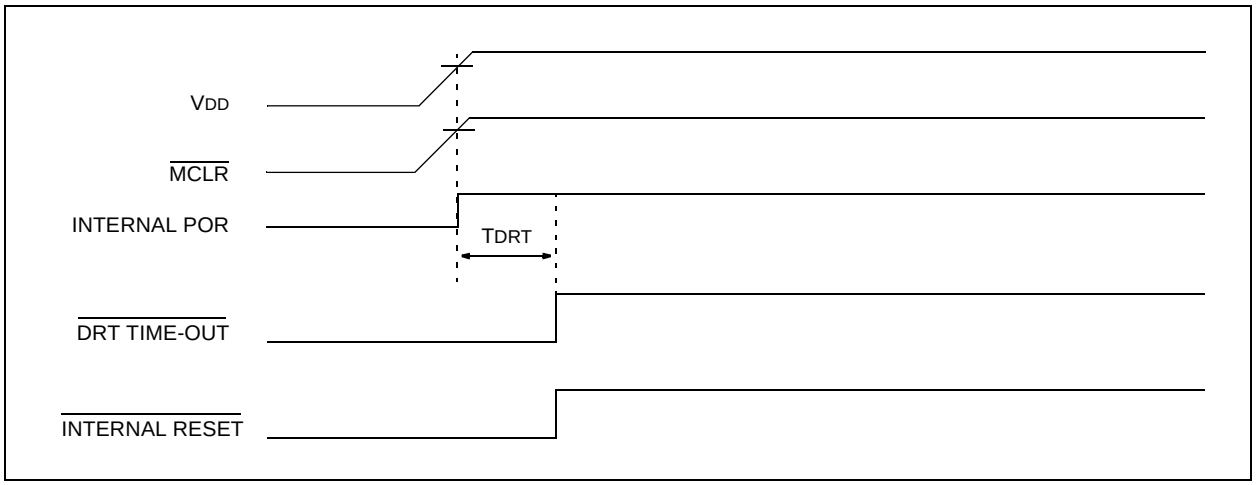

FIGURE 5-5: TIME-OUT SEQUENCE ON POWER-UP ($\overline{MCLR}$ TIED TO VDD): SLOW VDD RISE TIME

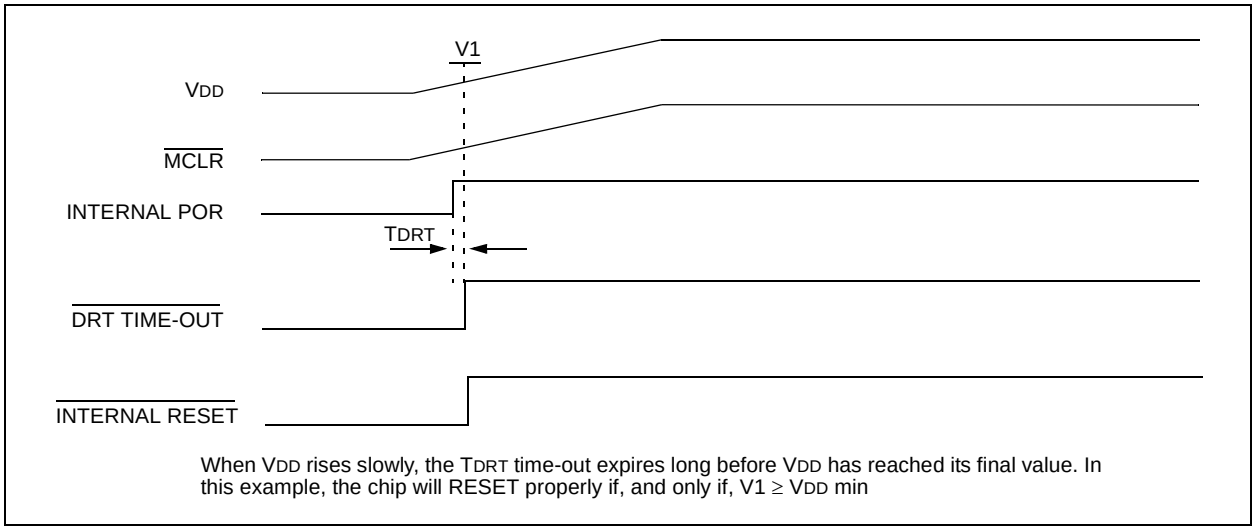


When VDD rises slowly, the TDRT time-out expires long before VDD has reached its final value. In this example, the chip will RESET properly if, and only if, V1 ≥ VDD min

6.7 Indirect Data Addressing; INDF and FSR Registers

The INDF Register is not a physical register. Addressing INDF actually addresses the register whose address is contained in the FSR Register (FSR is a *pointer*). This is indirect addressing.

EXAMPLE 6-1: INDIRECT ADDRESSING

- Register file 08 contains the value 10h
- Register file 09 contains the value 0Ah
- Load the value 08 into the FSR Register
- A read of the INDF Register will return the value of 10h
- Increment the value of the FSR Register by one (FSR = 09h)
- A read of the INDF register now will return the value of 0Ah.

Reading INDF itself indirectly (FSR = 0) will produce 00h. Writing to the INDF Register indirectly results in a no-operation (although STATUS bits may be affected).

A simple program to clear RAM locations 10h-1Fh using indirect addressing is shown in Example 6-2.

EXAMPLE 6-2: HOW TO CLEAR RAM USING INDIRECT ADDRESSING

```
            MOVLW   H'10'   ;initialize pointer
            MOVWF   FSR     ; to RAM
NEXT        CLRF    INDF    ;clear INDF Register
            INCF    FSR,F   ;inc pointer
            BTFSC   FSR,4   ;all done?
            GOTO    NEXT    ;NO, clear next
CONTINUE
            :               ;YES, continue
```

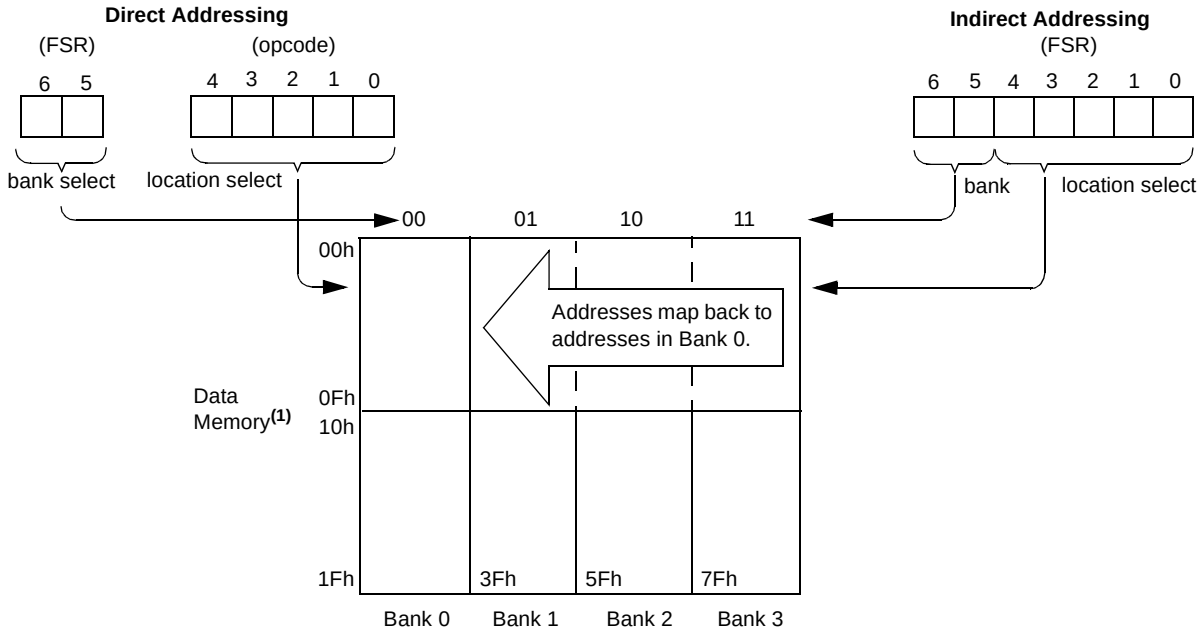
The FSR is either a 5-bit (PIC16C54, PIC16CR54, PIC16C55, PIC16C56, PIC16CR56) or 7-bit (PIC16C57, PIC16CR57, PIC16C58, PIC16CR58) wide register. It is used in conjunction with the INDF Register to indirectly address the data memory area.

The FSR<4:0> bits are used to select data memory addresses 00h to 1Fh.

PIC16C54, PIC16CR54, PIC16C55, PIC16C56, PIC16CR56: These do not use banking. FSR<6:5> bits are unimplemented and read as '1's.

PIC16C57, PIC16CR57, PIC16C58, PIC16CR58: FSR<6:5> are the bank select bits and are used to select the bank to be addressed (`00` = bank 0, `01` = bank 1, `10` = bank 2, `11` = bank 3).

FIGURE 6-10: DIRECT/INDIRECT ADDRESSING



Note 1: For register map detail see Section 6.2.

7.0 I/O PORTS

As with any other register, the I/O Registers can be written and read under program control. However, read instructions (e.g., MOVF PORTB,W) always read the I/O pins independent of the pin's input/output modes. On RESET, all I/O ports are defined as input (inputs are at hi-impedance) since the I/O control registers (TRISA, TRISB, TRISC) are all set.

7.1 PORTA

PORTA is a 4-bit I/O Register. Only the low order 4 bits are used (RA<3:0>). Bits 7-4 are unimplemented and read as '0's.

7.2 PORTB

PORTB is an 8-bit I/O Register (PORTB<7:0>).

7.3 PORTC

PORTC is an 8-bit I/O Register for PIC16C55, PIC16C57 and PIC16CR57.

PORTC is a General Purpose Register for PIC16C54, PIC16CR54, PIC16C56, PIC16CR56, PIC16C58 and PIC16CR58.

7.4 TRIS Registers

The Output Driver Control Registers are loaded with the contents of the W Register by executing the TRIS f instruction. A '1' from a TRIS Register bit puts the corresponding output driver in a hi-impedance (input) mode. A '0' puts the contents of the output data latch on the selected pins, enabling the output buffer.

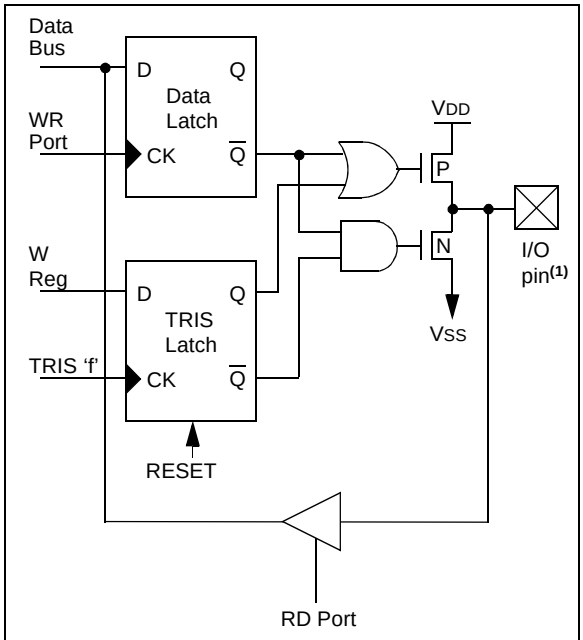
Note:	A read of the ports reads the pins, not the output data latches. That is, if an output driver on a pin is enabled and driven high, but the external system is holding it low, a read of the port will indicate that the pin is low.

The TRIS Registers are "write-only" and are set (output drivers disabled) upon RESET.

7.5 I/O Interfacing

The equivalent circuit for an I/O port pin is shown in Figure 7-1. All ports may be used for both input and output operation. For input operations these ports are non-latching. Any input must be present until read by an input instruction (e.g., MOVF PORTB, W). The outputs are latched and remain unchanged until the output latch is rewritten. To use a port pin as output, the corresponding direction control bit (in TRISA, TRISB, TRISC) must be cleared (= 0). For use as an input, the corresponding TRIS bit must be set. Any I/O pin can be programmed individually as input or output.

FIGURE 7-1: EQUIVALENT CIRCUIT FOR A SINGLE I/O PIN



Note 1: I/O pins have protection diodes to VDD and VSS.

TABLE 7-1: SUMMARY OF PORT REGISTERS

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on Power-On Reset	Value on MCLR and WDT Reset
N/A	TRIS	I/O Control Registers (TRISA, TRISB, TRISC)								1111 1111	1111 1111
05h	PORTA	—	—	—	—	RA3	RA2	RA1	RA0	---- xxxx	---- uuuu
06h	PORTB	RB7	RB6	RB5	RB4	RB3	RB2	RB1	RB0	xxxx xxxx	uuuu uuuu
07h	PORTC	RC7	RC6	RC5	RC4	RC3	RC2	RC1	RC0	xxxx xxxx	uuuu uuuu

Legend: x = unknown, u = unchanged, — = unimplemented, read as '0', Shaded cells = unimplemented, read as '0'

REGISTER 9-2: CONFIGURATION WORD FOR PIC16C54/C55/C56/C57

—	—	—	—	—	—	—	—	CP	WDTE	FOSC1	FOSC0

bit 11 bit 0

bit 11-4: **Unimplemented**: Read as '0'

bit 3: **CP:** Code protection bit.
1 = Code protection off
0 = Code protection on

bit 2: **WDTE:** Watchdog timer enable bit
1 = WDT enabled
0 = WDT disabled

bit 1-0: **FOSC1:FOSC0:** Oscillator selection bits(2)
00 = LP oscillator
01 = XT oscillator
10 = HS oscillator
11 = RC oscillator

Note 1: Refer to the PIC16C5X Programming Specifications (Literature Number DS30190) to determine how to access the configuration word.
2: PIC16LV54A supports XT, RC and LP oscillator only.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	1 = bit is set	0 = bit is cleared	x = bit is unknown

12.3 DC Characteristics: PIC16C54/55/56/57-RCE, XTE, 10E, HSE, LPE (Extended)

PIC16C54/55/56/57-RCE, XTE, 10E, HSE, LPE (Extended)			Standard Operating Conditions (unless otherwise specified) Operating Temperature –40°C ≤ TA ≤ +125°C for extended				
Param No.	**Symbol**	**Characteristic/Device**	**Min**	**Typ†**	**Max**	**Units**	**Conditions**
D001	VDD	**Supply Voltage**					
		PIC16C5X-RCE	3.25	—	6.0	V	
		PIC16C5X-XTE	3.25	—	6.0	V	
		PIC16C5X-10E	4.5	—	5.5	V	
		PIC16C5X-HSE	4.5	—	5.5	V	
		PIC16C5X-LPE	2.5	—	6.0	V	
D002	VDR	**RAM Data Retention Voltage(1)**	—	1.5*	—	V	Device in SLEEP mode
D003	VPOR	**VDD Start Voltage** to ensure Power-on Reset	—	VSS	—	V	See Section 5.1 for details on Power-on Reset
D004	SVDD	**VDD Rise Rate** to ensure Power-on Reset	0.05*	—	—	V/ms	See Section 5.1 for details on Power-on Reset
D010	IDD	**Supply Current(2)**					
		PIC16C5X-RCE(3)	—	1.8	3.3	mA	FOSC = 4 MHz, VDD = 5.5V
		PIC16C5X-XTE	—	1.8	3.3	mA	FOSC = 4 MHz, VDD = 5.5V
		PIC16C5X-10E	—	4.8	10	mA	FOSC = 10 MHz, VDD = 5.5V
		PIC16C5X-HSE	—	4.8	10	mA	FOSC = 10 MHz, VDD = 5.5V
		PIC16C5X-HSE	—	9.0	20	mA	FOSC = 16 MHz, VDD = 5.5V
		PIC16C5X-LPE	—	19	55	μA	FOSC = 32 kHz, VDD = 3.25V, WDT disabled
D020	IPD	**Power-down Current(2)**	—	5.0	22	μA	VDD = 3.25V, WDT enabled
			—	0.8	18	μA	VDD = 3.25V, WDT disabled

* These parameters are characterized but not tested.

† Data in "Typ" column is based on characterization results at 25°C. This data is for design guidance only and is not tested.

Note 1: This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as bus loading, oscillator type, bus rate, internal code execution pattern and temperature also have an impact on the current consumption.

a) The test conditions for all IDD measurements in active Operation mode are: OSC1 = external square wave, from rail-to-rail; all I/O pins tristated, pulled to VSS, T0CKI = VDD, $\overline{\text{MCLR}}$ = VDD; WDT enabled/disabled as specified.

b) For standby current measurements, the conditions are the same, except that the device is in SLEEP mode. The power-down current in SLEEP mode does not depend on the oscillator type.

3: Does not include current through REXT. The current through the resistor can be estimated by the formula: IR = VDD/2REXT (mA) with REXT in kΩ.

12.7 Timing Diagrams and Specifications

FIGURE 12-2: EXTERNAL CLOCK TIMING - PIC16C54/55/56/57

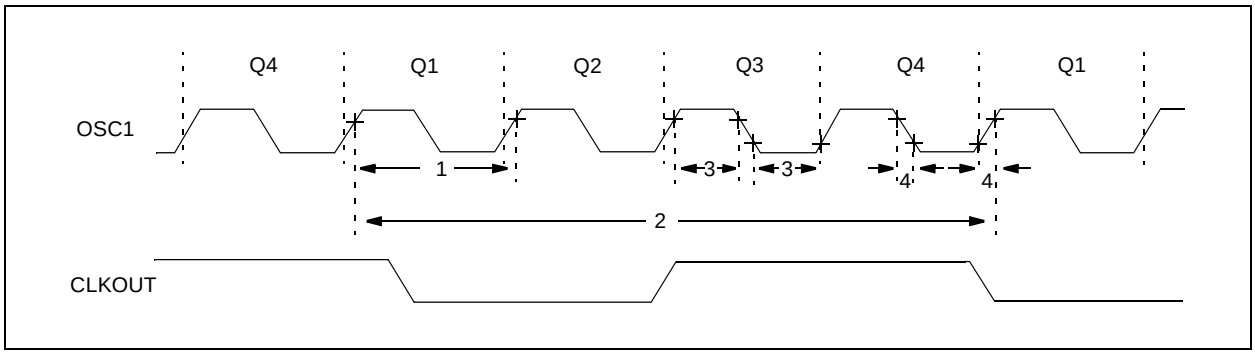


TABLE 12-1: EXTERNAL CLOCK TIMING REQUIREMENTS - PIC16C54/55/56/57

AC Characteristics		Standard Operating Conditions (unless otherwise specified) Operating Temperature 0°C ≤ TA ≤ +70°C for commercial –40°C ≤ TA ≤ +85°C for industrial –40°C ≤ TA ≤ +125°C for extended					
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ†**	**Max**	**Units**	**Conditions**
1A	FOSC	External CLKIN Frequency(1)	DC	—	4.0	MHz	XT OSC mode
			DC	—	10	MHz	10 MHz mode

			3.0	—	5.5	V	from 0 - 10 MHz
			4.5	—	5.5	V	from 10 - 20 MHz
D002	VDR	**RAM Data Retention Voltage(1)**	—	1.5*	—	V	Device in SLEEP mode
D003	VPOR	**VDD start voltage** to ensure Power-on Reset	—	Vss	—	V	See Section 5.1 for details on Power-on Reset
D004	SVDD	**VDD rise rate** to ensure Power-on Reset	0.05*	—	—	V/ms	See Section 5.1 for details on Power-on Reset
D010	IDD	**Supply Current(2)**					
		XT and RC(3) modes	—	1.8	3.3	mA	FOSC = 4.0 MHz, VDD = 5.5V
		HS mode	—	9.0	20	mA	FOSC = 20 MHz, VDD = 5.5V
D020	IPD	**Power-down Current(2)**	—	0.3	17	µA	VDD = 3.0V, WDT disabled
			—	10	50*	µA	VDD = 4.5V, WDT disabled
			—	12	60*	µA	VDD = 5.5V, WDT disabled
			—	4.8	31*	µA	VDD = 3.0V, WDT enabled
			—	18	68*	µA	VDD = 4.5V, WDT enabled
			—	26	90*	µA	VDD = 5.5V, WDT enabled

* These parameters are characterized but not tested.

† Data in "Typ" column is at 5V, 25°C, unless otherwise stated. These parameters are for design guidance only, and are not tested.

Note 1: This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as bus loading, oscillator type, bus rate, internal code execution pattern, and temperature also have an impact on the current consumption.

a) The test conditions for all IDD measurements in active Operation mode are: OSC1 = external square wave, from rail-to-rail; all I/O pins tristated, pulled to VSS, T0CKI = VDD, $\overline{MCLR}$ = VDD; WDT enabled/ disabled as specified.

b) For standby current measurements, the conditions are the same, except that the device is in SLEEP mode. The power-down current in SLEEP mode does not depend on the oscillator type.

3: Does not include current through REXT. The current through the resistor can be estimated by the formula: IR = VDD/2REXT (mA) with REXT in kΩ.

16	TckH2ioI	Port in hold after CLKOUT↑ **(1,2)**	0*	—	—	ns
17	TosH2ioV	OSC1↑ (Q1 cycle) to Port out valid **(2)**	—	—	100	ns
18	TosH2ioI	OSC1↑ (Q2 cycle) to Port input invalid (I/O in hold time)	TBD	—	—	ns
19	TioV2osH	Port input valid to OSC1↑ (I/O in setup time)	TBD	—	—	ns
20	TioR	Port output rise time **(2)**	—	10	25**	ns
21	TioF	Port output fall time **(2)**	—	10	25**	ns

* These parameters are characterized but not tested.

** These parameters are design targets and are not tested. No characterization data available at this time.

† Data in the Typical ("Typ") column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: Measurements are taken in RC Mode where CLKOUT output is 4 x TOSC.

2: Refer to Figure 19-2 for load conditions.

18-Lead Plastic Dual In-line (P) – 300 mil (PDIP)

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging
