

Welcome to E-XFL.COM

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	4MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	20
Program Memory Size	768B (512 x 12)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	24 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 6.25V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.600", 15.24mm)
Supplier Device Package	28-PDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16c55-xti-p

PIC16C5X

8-Bit EPROM/ROM-Based CMOS Microcontrollers

1.0 GENERAL DESCRIPTION

The PIC16C5X from Microchip Technology is a family of low cost, high performance, 8-bit fully static, EPROM/ROM-based CMOS microcontrollers. It employs a RISC architecture with only 33 single word/single cycle instructions. All instructions are single cycle except for program branches which take two cycles. The PIC16C5X delivers performance in an order of magnitude higher than its competitors in the same price category. The 12-bit wide instructions are highly symmetrical resulting in 2:1 code compression over other 8-bit microcontrollers in its class. The easy to use and easy to remember instruction set reduces development time significantly.

The PIC16C5X products are equipped with special features that reduce system cost and power requirements. The Power-on Reset (POR) and Device Reset Timer (DRT) eliminate the need for external RESET circuitry. There are four oscillator configurations to choose from, including the power saving LP (Low Power) oscillator and cost saving RC oscillator. Power saving SLEEP mode, Watchdog Timer and Code Protection features improve system cost, power and reliability.

The UV erasable Cerdip packaged versions are ideal for code development, while the cost effective One Time Programmable (OTP) versions are suitable for production in any volume. The customer can take full advantage of Microchip's price leadership in OTP microcontrollers, while benefiting from the OTP's flexibility.

The PIC16C5X products are supported by a full featured macro assembler, a software simulator, an in-circuit emulator, a low cost development programmer and a full featured programmer. All the tools are supported on IBM® PC and compatible machines.

1.1 Applications

The PIC16C5X series fits perfectly in applications ranging from high speed automotive and appliance motor control to low power remote transmitters/receivers, pointing devices and telecom processors. The EPROM technology makes customizing application programs (transmitter codes, motor speeds, receiver frequencies, etc.) extremely fast and convenient. The small footprint packages, for through hole or surface mounting, make this microcontroller series perfect for applications with space limitations. Low cost, low power, high performance ease of use and I/O flexibility make the PIC16C5X series very versatile even in areas where no microcontroller use has been considered before (e.g., timer functions, replacement of "glue" logic in larger systems, co-processor applications).

PIC16C5X

FIGURE 3-1: PIC16C5X SERIES BLOCK DIAGRAM

PIC16C5X

NOTES:

7.0 I/O PORTS

As with any other register, the I/O Registers can be written and read under program control. However, read instructions (e.g., `MOVF PORTB, W`) always read the I/O pins independent of the pin's input/output modes. On RESET, all I/O ports are defined as input (inputs are at hi-impedance) since the I/O control registers (TRISA, TRISB, TRISC) are all set.

7.1 PORTA

PORTA is a 4-bit I/O Register. Only the low order 4 bits are used ($RA<3:0>$). Bits 7-4 are unimplemented and read as '0's.

7.2 PORTB

PORTB is an 8-bit I/O Register ($PORTB<7:0>$).

7.3 PORTC

PORTC is an 8-bit I/O Register for PIC16C55, PIC16C57 and PIC16CR57.

PORTC is a General Purpose Register for PIC16C54, PIC16CR54, PIC16C56, PIC16CR56, PIC16C58 and PIC16CR58.

7.4 TRIS Registers

The Output Driver Control Registers are loaded with the contents of the W Register by executing the `TRIS f` instruction. A '1' from a TRIS Register bit puts the corresponding output driver in a hi-impedance (input) mode. A '0' puts the contents of the output data latch on the selected pins, enabling the output buffer.

Note: A read of the ports reads the pins, not the output data latches. That is, if an output driver on a pin is enabled and driven high, but the external system is holding it low, a read of the port will indicate that the pin is low.

The TRIS Registers are "write-only" and are set (output drivers disabled) upon RESET.

7.5 I/O Interfacing

The equivalent circuit for an I/O port pin is shown in Figure 7-1. All ports may be used for both input and output operation. For input operations these ports are non-latching. Any input must be present until read by an input instruction (e.g., `MOVF PORTB, W`). The outputs are latched and remain unchanged until the output latch is rewritten. To use a port pin as output, the corresponding direction control bit (in TRISA, TRISB, TRISC) must be cleared ($= 0$). For use as an input, the corresponding TRIS bit must be set. Any I/O pin can be programmed individually as input or output.

FIGURE 7-1: EQUIVALENT CIRCUIT FOR A SINGLE I/O PIN

TABLE 7-1: SUMMARY OF PORT REGISTERS

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on Power-On Reset	Value on MCLR and WDT Reset
N/A	TRIS	I/O Control Registers (TRISA, TRISB, TRISC)								1111 1111	1111 1111
05h	PORTA	—	—	—	—	RA3	RA2	RA1	RA0	---- xxxx	---- uuuu
06h	PORTB	RB7	RB6	RB5	RB4	RB3	RB2	RB1	RB0	xxxx xxxx	uuuu uuuu
07h	PORTC	RC7	RC6	RC5	RC4	RC3	RC2	RC1	RC0	xxxx xxxx	uuuu uuuu

Legend: x = unknown, u = unchanged, — = unimplemented, read as '0', Shaded cells = unimplemented, read as '0'

PIC16C5X

NOTES:

PIC16C5X

RLF Rotate Left f through Carry

Syntax: [*label*] RLF f,d

Operands: $0 \leq f \leq 31$
 $d \in [0,1]$

Operation: See description below

Status Affected: C

Encoding:

0011	01df	ffff
------	------	------

Description: The contents of register 'f' are rotated one bit to the left through the Carry Flag (STATUS<0>). If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Example: RLF REG1,0

Before Instruction

REG1 = 1110 0110

C = 0

After Instruction

REG1 = 1110 0110

W = 1100 1100

C = 1

RRF Rotate Right f through Carry

Syntax: [*label*] RRF f,d

Operands: $0 \leq f \leq 31$
 $d \in [0,1]$

Operation: See description below

Status Affected: C

Encoding:

0011	00df	ffff
------	------	------

Description: The contents of register 'f' are rotated one bit to the right through the Carry Flag (STATUS<0>). If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'.

Words: 1

Cycles: 1

Example: RRF REG1,0

Before Instruction

REG1 = 1110 0110

C = 0

After Instruction

REG1 = 1110 0110

W = 0111 0011

C = 0

SLEEP Enter SLEEP Mode

Syntax: [*label*] SLEEP

Operands: None

Operation: 00h → WDT;
 0 → WDT prescaler; if assigned
 1 → \overline{TO} ;
 0 → \overline{PD}

Status Affected: \overline{TO} , \overline{PD}

Encoding:

0000	0000	0011
------	------	------

Description: Time-out status bit (\overline{TO}) is set. The power-down status bit (\overline{PD}) is cleared. The WDT and its prescaler are cleared.
 The processor is put into SLEEP mode with the oscillator stopped. See section on SLEEP for more details.

Words: 1

Cycles: 1

Example: SLEEP

13.0 ELECTRICAL CHARACTERISTICS - PIC16CR54A

Absolute Maximum Ratings^(†)

Ambient Temperature under bias	–55°C to +125°C
Storage Temperature	–65°C to +150°C
Voltage on VDD with respect to VSS	0 to +7.5V
Voltage on MCLR with respect to VSS ⁽¹⁾	0 to +14V
Voltage on all other pins with respect to VSS	–0.6V to (VDD + 0.6V)
Total power dissipation ⁽²⁾	800 mW
Max. current out of VSS pin	150 mA
Max. current into VDD pin	50 mA
Max. current into an input pin (TOCKI only)	±500 µA
Input clamp current, I _{IK} (V _I < 0 or V _I > VDD)	±20 mA
Output clamp current, I _{OK} (V _O < 0 or V _O > VDD)	±20 mA
Max. output current sunk by any I/O pin	25 mA
Max. output current sourced by any I/O pin	20 mA
Max. output current sourced by a single I/O port (PORTA or B)	40 mA
Max. output current sunk by a single I/O port (PORTA or B)	50 mA

Note 1: Voltage spikes below VSS at the MCLR pin, inducing currents greater than 80 mA may cause latch-up. Thus, a series resistor of 50 to 100 Ω should be used when applying a low level to the MCLR pin rather than pulling this pin directly to VSS.

2: Power Dissipation is calculated as follows: $P_{DIS} = V_{DD} \times \{I_{DD} - \sum I_{OH}\} + \sum \{(V_{DD} - V_{OH}) \times I_{OH}\} + \sum (V_{OL} \times I_{OL})$

† NOTICE: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 13-1: EXTERNAL CLOCK TIMING REQUIREMENTS - PIC16CR54A

Standard Operating Conditions (unless otherwise specified) Operating Temperature $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$ for commercial $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for extended							
Param No.	Symbol	Characteristic	Min	Typ†	Max	Units	Conditions
1	Tosc	External CLKIN Period ⁽¹⁾	250	—	—	ns	XT osc mode
			250	—	—	ns	HS osc mode (04)
			100	—	—	ns	HS osc mode (10)
			50	—	—	ns	HS osc mode (20)
			5.0	—	—	μs	LP osc mode
		Oscillator Period ⁽¹⁾	250	—	—	ns	RC osc mode
			250	—	10,000	ns	XT osc mode
			250	—	250	ns	HS osc mode (04)
			100	—	250	ns	HS osc mode (10)
			50	—	250	ns	HS osc mode (20)
			5.0	—	200	μs	LP osc mode
2	Tcy	Instruction Cycle Time ⁽²⁾	—	4/Fosc	—	—	
3	TosL, TosH	Clock in (OSC1) Low or High Time	50*	—	—	ns	XT oscillator
			20*	—	—	ns	HS oscillator
			2.0*	—	—	μs	LP oscillator
4	TosR, TosF	Clock in (OSC1) Rise or Fall Time	—	—	25*	ns	XT oscillator
			—	—	25*	ns	HS oscillator
			—	—	50*	ns	LP oscillator

* These parameters are characterized but not tested.

† Data in the Typical ("Typ") column is based on characterization results at 25°C. This data is for design guidance only and is not tested.

Note 1: All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption.

When an external clock input is used, the "max" cycle time limit is "DC" (no clock) for all devices.

2: Instruction cycle period (TCY) equals four times the input oscillator time base period.

15.0 ELECTRICAL CHARACTERISTICS - PIC16C54A

Absolute Maximum Ratings^(†)

PIC16C5X

15.3 DC Characteristics: PIC16LV54A-02 (Commercial) PIC16LV54A-02I (Industrial)

PIC16LV54A-02 PIC16LV54A-02I (Commercial, Industrial)			Standard Operating Conditions (unless otherwise specified)				
			Operating Temperature $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$ for commercial $-20^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for industrial				
Param No.	Symbol	Characteristic	Min	Typ†	Max	Units	Conditions
D001	V _{DD}	Supply Voltage RC and XT modes	2.0	—	3.8	V	
D002	V _{DR}	RAM Data Retention Voltage⁽¹⁾	—	1.5*	—	V	Device in SLEEP mode
D003	V _{POR}	V_{DD} Start Voltage to ensure Power-on Reset	—	V _{SS}	—	V	See Section 5.1 for details on Power-on Reset
D004	S _{VDD}	V_{DD} Rise Rate to ensure Power-on Reset	0.05*	—	—	V/ms	See Section 5.1 for details on Power-on Reset
D010	I _{DD}	Supply Current⁽²⁾ RC ⁽³⁾ and XT modes LP mode, Commercial LP mode, Industrial	— — —	0.5 11 14	— 27 35	mA μA μA	FOSC = 2.0 MHz, V _{DD} = 3.0V FOSC = 32 kHz, V _{DD} = 2.5V WDT disabled FOSC = 32 kHz, V _{DD} = 2.5V WDT disabled
D020	I _{PD}	Power-down Current^(2,4) Commercial Commercial Industrial Industrial	— — — —	2.5 0.25 3.5 0.3	12 4.0 14 5.0	μA μA μA μA	V _{DD} = 2.5V, WDT enabled V _{DD} = 2.5V, WDT disabled V _{DD} = 2.5V, WDT enabled V _{DD} = 2.5V, WDT disabled

* These parameters are characterized but not tested.

† Data in the Typical ("Typ") column is based on characterization results at 25°C. This data is for design guidance only and is not tested.

Note 1: This is the limit to which V_{DD} can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as bus loading, oscillator type, bus rate, internal code execution pattern and temperature also have an impact on the current consumption.

a) The test conditions for all I_{DD} measurements in active Operation mode are: OSC1 = external square wave, from rail-to-rail; all I/O pins tristated, pulled to V_{SS}, T0CKI = V_{DD}, MCLR = V_{DD}; WDT enabled/disabled as specified.

b) For standby current measurements, the conditions are the same, except that the device is in SLEEP mode. The power-down current in SLEEP mode does not depend on the oscillator type.

3: Does not include current through R_{EXT}. The current through the resistor can be estimated by the formula: $I_R = V_{DD}/2R_{EXT}$ (mA) with R_{EXT} in kΩ.

4: The oscillator start-up time can be as much as 8 seconds for XT and LP oscillator selection on wake-up from SLEEP mode or during initial power-up.

15.5 Timing Parameter Symbolology and Load Conditions

The timing parameter symbols have been created with one of the following formats:

- 1. TppS2ppS
- 2. TppS

T	T
F Frequency	T Time

Lowercase letters (pp) and their meanings:

pp	mc $\overline{\text{MCLR}}$
2 to	osc oscillator
ck CLKOUT	os OSC1
cy cycle time	t0 T0CKI
drt device reset timer	wdt watchdog timer
io I/O port	

Uppercase letters and their meanings:

S	P Period
F Fall	R Rise
H High	V Valid
I Invalid (Hi-impedance)	Z Hi-impedance
L Low
