What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	4MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	12
Program Memory Size	3KB (2K x 12)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	73 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	-
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	18-SOIC (0.295", 7.50mm Width)
Supplier Device Package	18-SOIC

T0CKI	3	3	3	I	ST	Clock input to Timer0. Must be tied to V_{SS} or V_{DD}, if not in use, to reduce current consumption.
$\overline{MCLR}/V_{PP}$	4	4	4	I	ST	Master clear (RESET) input/programming voltage input. This pin is an active low RESET to the device. Voltage on the $\overline{MCLR}/V_{PP}$ pin must not exceed V_{DD} to avoid unintended entering of Programming mode.
OSC1/CLKIN	16	16	18	I	ST	Oscillator crystal input/external clock source input.
OSC2/CLKOUT	15	15	17	O	—	Oscillator crystal output. Connects to crystal or resonator in crystal Oscillator mode. In RC mode, OSC2 pin outputs CLKOUT, which has 1/4 the frequency of OSC1 and denotes the instruction cycle rate.
V_{DD}	14	14	15,16	P	—	Positive supply for logic and I/O pins.
V_{SS}	5	5	5,6	P	—	Ground reference for logic and I/O pins.

6.0 MEMORY ORGANIZATION

PIC16C5X memory is organized into program memory and data memory. For devices with more than 512 bytes of program memory, a paging scheme is used. Program memory pages are accessed using one or two STATUS Register bits. For devices with a data memory register file of more than 32 registers, a banking scheme is used. Data memory banks are accessed using the File Selection Register (FSR).

6.1 Program Memory Organization

The PIC16C54, PIC16CR54 and PIC16C55 have a 9-bit Program Counter (PC) capable of addressing a 512 x 12 program memory space (Figure 6-1). The PIC16C56 and PIC16CR56 have a 10-bit Program Counter (PC) capable of addressing a 1K x 12 program memory space (Figure 6-2). The PIC16CR57, PIC16C58 and PIC16CR58 have an 11-bit Program Counter capable of addressing a 2K x 12 program memory space (Figure 6-3). Accessing a location above the physically implemented address will cause a wraparound.

A NOP at the RESET vector location will cause a restart at location 000h. The RESET vector for the PIC16C54, PIC16CR54 and PIC16C55 is at 1FFh. The RESET vector for the PIC16C56 and PIC16CR56 is at 3FFh. The RESET vector for the PIC16C57, PIC16CR57, PIC16C58, and PIC16CR58 is at 7FFh. See Section 6.5 for additional information using CALL and GOTO instructions.

9.2 Watchdog Timer (WDT)

The Watchdog Timer (WDT) is a free running on-chip RC oscillator which does not require any external components. This RC oscillator is separate from the RC oscillator of the OSC1/CLKIN pin. That means that the WDT will run even if the clock on the OSC1/CLKIN and OSC2/CLKOUT pins have been stopped, for example, by execution of a SLEEP instruction. During normal operation or SLEEP, a WDT Reset or Wake-up Reset generates a device RESET.

The $\overline{TO}$ bit (STATUS<4>) will be cleared upon a Watchdog Timer Reset (Section 6.3).

The WDT can be permanently disabled by programming the configuration bit WDTE as a '0' (Section 9.1). Refer to the PIC16C5X Programming Specifications (Literature Number DS30190) to determine how to access the configuration word.

9.2.1 WDT PERIOD

An 8-bit counter is available as a prescaler for the Timer0 module (Section 8.2), or as a postscaler for the Watchdog Timer (WDT), respectively. For simplicity, this counter is being referred to as “prescaler” throughout this data sheet. Note that the prescaler may be used by either the Timer0 module or the WDT, but not both. Thus, a prescaler assignment for the Timer0 module means that there is no prescaler for the WDT, and vice-versa.

The PSA and PS<2:0> bits (OPTION<3:0>) determine prescaler assignment and prescale ratio (Section 6.4).

The WDT has a nominal time-out period of 18 ms (with no prescaler). If a longer time-out period is desired, a prescaler with a division ratio of up to 1:128 can be assigned to the WDT (under software control) by writing to the OPTION register. Thus, time-out a period of a nominal 2.3 seconds can be realized. These periods vary with temperature, VDD and part-to-part process variations (see Device Characterization).

Under worst case conditions (VDD = Min., Temperature = Max., WDT prescaler = 1:128), it may take several seconds before a WDT time-out occurs.

9.2.2 WDT PROGRAMMING CONSIDERATIONS

The CLRWDT instruction clears the WDT and the prescaler, if assigned to the WDT, and prevents it from timing out and generating a device RESET.

The SLEEP instruction RESETS the WDT and the prescaler, if assigned to the WDT. This gives the maximum SLEEP time before a WDT Wake-up Reset.

Note: T0CS, T0SE, PSA, PS2:PS0 are bits in the OPTION register.

RLF **Rotate Left f through Carry**

Syntax: [*label*] RLF f,d

Operands: $0 \le f \le 31$
$d \in [0,1]$

Operation: See description below

Status Affected: C

Encoding:

0011	01df	ffff

Description: The contents of register 'f' are rotated one bit to the left through the Carry Flag (STATUS<0>). If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Example:
```
RLF    REG1,0
```
Before Instruction
```
REG1    =  1110 0110
C       =  0
```
After Instruction
```
REG1    =  1110 0110
W       =  1100 1100
C       =  1
```

RRF **Rotate Right f through Carry**

Syntax: [*label*] RRF f,d

Operands: $0 \le f \le 31$
$d \in [0,1]$

Operation: See description below

Status Affected: C

Encoding:

0011	00df	ffff

Description: The contents of register 'f' are rotated one bit to the right through the Carry Flag (STATUS<0>). If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'.

Words: 1

Cycles: 1

Example:
```
RRF    REG1,0
```
Before Instruction
```
REG1    =  1110 0110
C       =  0
```
After Instruction
```
REG1    =  1110 0110
W       =  0111 0011
C       =  0
```

SLEEP **Enter SLEEP Mode**

Syntax: [*label*] SLEEP

Operands: None

Operation: 00h → WDT;
0 → WDT prescaler; if assigned
1 → $\overline{TO}$;
0 → $\overline{PD}$

Status Affected: $\overline{TO}$, $\overline{PD}$

Encoding:

0000	0000	0011

Description: Time-out status bit ($\overline{TO}$) is set. The power-down status bit ($\overline{PD}$) is cleared. The WDT and its prescaler are cleared.
The processor is put into SLEEP mode with the oscillator stopped. See section on SLEEP for more details.

Words: 1

Cycles: 1

Example:
```

Legend: Rows with standard voltage device data only are shaded for improved readability.

* These parameters are characterized but not tested.

† Data in the Typical ("Typ") column is based on characterization results at 25°C. This data is for design guidance only and is not tested.

Note 1: This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as bus loading, oscillator type, bus rate, internal code execution pattern and temperature also have an impact on the current consumption.

a) The test conditions for all IDD measurements in active Operation mode are: OSC1 = external square wave, from rail-to-rail; all I/O pins tristated, pulled to VSS, T0CKI = VDD, $\overline{MCLR}$ = VDD; WDT enabled/disabled as specified.

b) For standby current measurements, the conditions are the same, except that the device is in SLEEP mode. The power-down current in SLEEP mode does not depend on the oscillator type.

3: Does not include current through REXT. The current through the resistor can be estimated by the formula: IR = VDD/2REXT (mA) with REXT in kΩ.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
═ ISO/TS 16949 ═

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
