

Welcome to [E-XFL.COM](http://E-XFL.COM)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	4MHz
Connectivity	-
Peripherals	POR, WDT
Number of I/O	12
Program Memory Size	1.5KB (1K x 12)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	25 x 8
Voltage - Supply (Vcc/Vdd)	2.5V ~ 5.5V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SSOP (0.209", 5.30mm Width)
Supplier Device Package	20-SSOP
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic16lc56a-04i-ss">https://www.e-xfl.com/product-detail/microchip-technology/pic16lc56a-04i-ss</a>

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@mail.microchip.com](mailto:docerrors@mail.microchip.com) or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)
- The Microchip Corporate Literature Center; U.S. FAX: (480) 792-7277

When contacting a sales office or the literature center, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### Customer Notification System

Register on our web site at [www.microchip.com/cn](http://www.microchip.com/cn) to receive the most current information on all of our products.

## 4.3 External Crystal Oscillator Circuit

Either a prepackaged oscillator or a simple oscillator circuit with TTL gates can be used as an external crystal oscillator circuit. Prepackaged oscillators provide a wide operating range and better stability. A well-designed crystal oscillator will provide good performance with TTL gates. Two types of crystal oscillator circuits can be used: one with parallel resonance, or one with series resonance.

Figure 4-3 shows an implementation example of a parallel resonant oscillator circuit. The circuit is designed to use the fundamental frequency of the crystal. The 74AS04 inverter performs the 180-degree phase shift that a parallel oscillator requires. The 4.7 k $\Omega$  resistor provides the negative feedback for stability. The 10 k $\Omega$  potentiometers bias the 74AS04 in the linear region. This circuit could be used for external oscillator designs.

**FIGURE 4-3: EXAMPLE OF EXTERNAL PARALLEL RESONANT CRYSTAL OSCILLATOR CIRCUIT (USING XT, HS OR LP OSCILLATOR MODE)**

Figure 4-4 shows a series resonant oscillator circuit. This circuit is also designed to use the fundamental frequency of the crystal. The inverter performs a 180-degree phase shift in a series resonant oscillator circuit. The 330 k $\Omega$  resistors provide the negative feedback to bias the inverters in their linear region.

**FIGURE 4-4: EXAMPLE OF EXTERNAL SERIES RESONANT CRYSTAL OSCILLATOR CIRCUIT (USING XT, HS OR LP OSCILLATOR MODE)**

## 5.1 Power-On Reset (POR)

The PIC16C5X family incorporates on-chip Power-On Reset (POR) circuitry which provides an internal chip RESET for most power-up situations. To use this feature, the user merely ties the  $\overline{\text{MCLR}}/\text{VPP}$  pin to  $\text{VDD}$ . A simplified block diagram of the on-chip Power-On Reset circuit is shown in Figure 5-1.

The Power-On Reset circuit and the Device Reset Timer (Section 5.2) circuit are closely related. On power-up, the RESET latch is set and the DRT is RESET. The DRT timer begins counting once it detects  $\overline{\text{MCLR}}$  to be high. After the time-out period, which is typically 18 ms, it will RESET the reset latch and thus end the on-chip RESET signal.

A power-up example where  $\overline{\text{MCLR}}$  is not tied to  $\text{VDD}$  is shown in Figure 5-3.  $\text{VDD}$  is allowed to rise and stabilize before bringing  $\overline{\text{MCLR}}$  high. The chip will actually come out of reset  $\text{T}_{\text{DRT}}$  msec after  $\overline{\text{MCLR}}$  goes high.

In Figure 5-4, the on-chip Power-On Reset feature is being used ( $\overline{\text{MCLR}}$  and  $\text{VDD}$  are tied together). The  $\text{VDD}$  is stable before the start-up timer times out and there is no problem in getting a proper RESET. However, Figure 5-5 depicts a problem situation where  $\text{VDD}$  rises too slowly. The time between when the DRT senses a high on the  $\overline{\text{MCLR}}/\text{VPP}$  pin, and when the  $\overline{\text{MCLR}}/\text{VPP}$  pin (and  $\text{VDD}$ ) actually reach their full value, is too long. In this situation, when the start-up timer times out,  $\text{VDD}$  has not reached the  $\text{VDD}(\text{min})$  value and the chip is, therefore, not guaranteed to function correctly. For such situations, we recommend that external RC circuits be used to achieve longer POR delay times (Figure 5-2).

**Note:** When the device starts normal operation (exits the RESET condition), device operating parameters (voltage, frequency, temperature, etc.) must be met to ensure operation. If these conditions are not met, the device must be held in RESET until the operating conditions are met.

For more information on PIC16C5X POR, see *Power-Up Considerations* - AN522 in the [Embedded Control Handbook](#).

The POR circuit does not produce an internal RESET when  $\text{VDD}$  declines.

**FIGURE 5-2: EXTERNAL POWER-ON RESET CIRCUIT (FOR SLOW  $\text{VDD}$  POWER-UP)**

## 6.7 Indirect Data Addressing; INDF and FSR Registers

The INDF Register is not a physical register. Addressing INDF actually addresses the register whose address is contained in the FSR Register (FSR is a *pointer*). This is indirect addressing.

### EXAMPLE 6-1: INDIRECT ADDRESSING

- Register file 08 contains the value 10h
- Register file 09 contains the value 0Ah
- Load the value 08 into the FSR Register
- A read of the INDF Register will return the value of 10h
- Increment the value of the FSR Register by one (FSR = 09h)
- A read of the INDF register now will return the value of 0Ah.

Reading INDF itself indirectly (FSR = 0) will produce 00h. Writing to the INDF Register indirectly results in a no-operation (although STATUS bits may be affected).

A simple program to clear RAM locations 10h-1Fh using indirect addressing is shown in Example 6-2.

### EXAMPLE 6-2: HOW TO CLEAR RAM USING INDIRECT ADDRESSING

```

MOV LW  H'10'    ;initialize pointer
MOV WF  FSR      ; to RAM
NEXT    CLR F    INDF ;clear INDF Register
        INC F    FSR,F ;inc pointer
        BTFSC   FSR,4 ;all done?
        GOTO    NEXT ;NO, clear next

CONTINUE
        :          ;YES, continue
    
```

The FSR is either a 5-bit (PIC16C54, PIC16CR54, PIC16C55, PIC16CR55, PIC16C56, PIC16CR56) or 7-bit (PIC16C57, PIC16CR57, PIC16C58, PIC16CR58) wide register. It is used in conjunction with the INDF Register to indirectly address the data memory area.

The FSR<4:0> bits are used to select data memory addresses 00h to 1Fh.

**PIC16C54, PIC16CR54, PIC16C55, PIC16CR55, PIC16C56, PIC16CR56:** These do not use banking. FSR<6:5> bits are unimplemented and read as '1's.

**PIC16C57, PIC16CR57, PIC16C58, PIC16CR58:** FSR<6:5> are the bank select bits and are used to select the bank to be addressed (00 = bank 0, 01 = bank 1, 10 = bank 2, 11 = bank 3).

FIGURE 6-10: DIRECT/INDIRECT ADDRESSING

## 7.6 I/O Programming Considerations

### 7.6.1 BI-DIRECTIONAL I/O PORTS

Some instructions operate internally as read followed by write operations. The BCF and BSF instructions, for example, read the entire port into the CPU, execute the bit operation and re-write the result. Caution must be used when these instructions are applied to a port where one or more pins are used as input/outputs. For example, a BSF operation on bit5 of PORTB will cause all eight bits of PORTB to be read into the CPU, bit5 to be set and the PORTB value to be written to the output latches. If another bit of PORTB is used as a bi-directional I/O pin (say bit0) and it is defined as an input at this time, the input signal present on the pin itself would be read into the CPU and rewritten to the data latch of this particular pin, overwriting the previous content. As long as the pin stays in the Input mode, no problem occurs. However, if bit0 is switched into Output mode later on, the content of the data latch may now be unknown.

Example 7-1 shows the effect of two sequential read-modify-write instructions (e.g., BCF, BSF, etc.) on an I/O port.

A pin actively outputting a high or a low should not be driven from external devices at the same time in order to change the level on this pin ("wired-or", "wired-and"). The resulting high output currents may damage the chip.

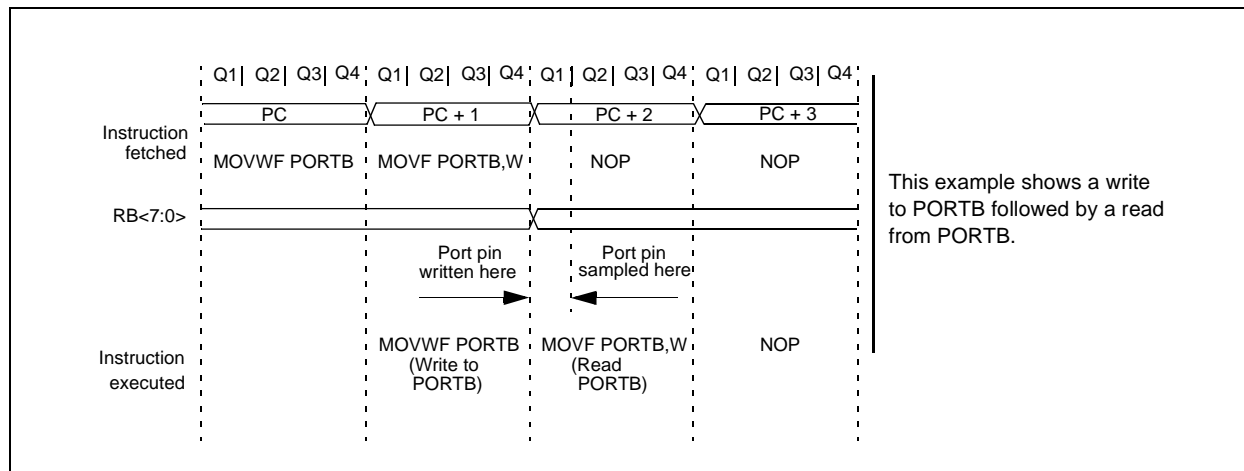

### EXAMPLE 7-1: READ-MODIFY-WRITE INSTRUCTIONS ON AN I/O PORT

```
;Initial PORT Settings
; PORTB<7:4> Inputs
; PORTB<3:0> Outputs
;PORTB<7:6> have external pull-ups and are
;not connected to other circuitry
;
;                                PORT latch  PORT pins
;                                - - - - - - - - - -
BCF  PORTB, 7  ;01pp pppp  11pp pppp
BCF  PORTB, 6  ;10pp pppp  11pp pppp
MOVLW H'3F'    ;
TRIS  PORTB    ;10pp pppp  10pp pppp
;
;Note that the user may have expected the pin
;values to be 00pp pppp. The 2nd BCF caused
;RB7 to be latched as the pin value (High).
```

### 7.6.2 SUCCESSIVE OPERATIONS ON I/O PORTS

The actual write to an I/O port happens at the end of an instruction cycle, whereas for reading, the data must be valid at the beginning of the instruction cycle (Figure 7-2). Therefore, care must be exercised if a write followed by a read operation is carried out on the same I/O port. The sequence of instructions should allow the pin voltage to stabilize (load dependent) before the next instruction, which causes that file to be read into the CPU, is executed. Otherwise, the previous state of that pin may be read into the CPU rather than the new state. When in doubt, it is better to separate these instructions with a NOP or another instruction not accessing this I/O port.

FIGURE 7-2: SUCCESSIVE I/O OPERATION

**FIGURE 8-6: BLOCK DIAGRAM OF THE TIMER0/WDT PRESCALER**

## REGISTER 9-2: CONFIGURATION WORD FOR PIC16C54/C55/C56/C57

—	—	—	—	—	—	—	—	CP	WDTE	FOSC1	FOSC0
bit 11											bit 0

bit 11-4: **Unimplemented:** Read as '0'

bit 3: **CP:** Code protection bit.  
 1 = Code protection off  
 0 = Code protection on

bit 2: **WDTE:** Watchdog timer enable bit  
 1 = WDT enabled  
 0 = WDT disabled

bit 1-0: **FOSC1:FOSC0:** Oscillator selection bits<sup>(2)</sup>  
 00 = LP oscillator  
 01 = XT oscillator  
 10 = HS oscillator  
 11 = RC oscillator

- Note 1:** Refer to the PIC16C5X Programming Specifications (Literature Number DS30190) to determine how to access the configuration word.  
**2:** PIC16LV54A supports XT, RC and LP oscillator only.

### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	1 = bit is set	0 = bit is cleared      x = bit is unknown

## 10.0 INSTRUCTION SET SUMMARY

Each PIC16C5X instruction is a 12-bit word divided into an OPCODE, which specifies the instruction type and one or more operands which further specify the operation of the instruction. The PIC16C5X instruction set summary in Table 10-2 groups the instructions into byte-oriented, bit-oriented, and literal and control operations. Table 10-1 shows the opcode field descriptions.

For **byte-oriented** instructions, 'f' represents a file register designator and 'd' represents a destination designator. The file register designator is used to specify which one of the 32 file registers in that bank is to be used by the instruction.

The destination designator specifies where the result of the operation is to be placed. If 'd' is '0', the result is placed in the W register. If 'd' is '1', the result is placed in the file register specified in the instruction.

For **bit-oriented** instructions, 'b' represents a bit field designator which selects the number of the bit affected by the operation, while 'f' represents the number of the file in which the bit is located.

For **literal and control** operations, 'k' represents an 8 or 9-bit constant or literal value.

**TABLE 10-1: OPCODE FIELD DESCRIPTIONS**

Field	Description
<i>f</i>	Register file address (0x00 to 0x1F)
<i>W</i>	Working register (accumulator)
<i>b</i>	Bit address within an 8-bit file register
<i>k</i>	Literal field, constant data or label
<i>x</i>	Don't care location (= 0 or 1) The assembler will generate code with <i>x</i> = 0. It is the recommended form of use for compatibility with all Microchip software tools.
<i>d</i>	Destination select; d = 0 (store result in W) d = 1 (store result in file register 'f') Default is d = 1
<i>label</i>	Label name
<i>TOS</i>	Top of Stack
<i>PC</i>	Program Counter
<i>WDT</i>	Watchdog Timer Counter
<i>TO</i>	Time-out bit
<i>PD</i>	Power-down bit
<i>dest</i>	Destination, either the W register or the specified register file location
[ ]	Options
( )	Contents
→	Assigned to
< >	Register bit field
∈	In the set of
<i>italics</i>	User defined term (font is courier)

All instructions are executed within one single instruction cycle, unless a conditional test is true or the program counter is changed as a result of an instruction. In this case, the execution takes two instruction cycles. One instruction cycle consists of four oscillator periods. Thus, for an oscillator frequency of 4 MHz, the normal instruction execution time would be 1 μs. If a conditional test is true or the program counter is changed as a result of an instruction, the instruction execution time would be 2 μs.

Figure 10-1 shows the three general formats that the instructions can have. All examples in the figure use the following format to represent a hexadecimal number:

0xhhh

where 'h' signifies a hexadecimal digit.

**FIGURE 10-1: GENERAL FORMAT FOR INSTRUCTIONS**

Legend: Rows with standard voltage device data only are shaded for improved readability.

\* These parameters are characterized but not tested.

† Data in "Typ" column is based on characterization results at 25°C. This data is for design guidance only and is not tested.

**Note 1:** This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

**2:** The supply current is mainly a function of the operating voltage and frequency. Other factors such as bus loading, oscillator type, bus rate, internal code execution pattern and temperature also have an impact on the current consumption.

a) The test conditions for all IDD measurements in active Operation mode are: OSC1 = external square wave, from rail-to-rail; all I/O pins tristated, pulled to VSS, T0CKI = VDD, MCLR = VDD; WDT enabled/disabled as specified.

b) For standby current measurements, the conditions are the same, except that the device is in SLEEP mode. The power-down current in SLEEP mode does not depend on the oscillator type.

**3:** Does not include current through REXT. The current through the resistor can be estimated by the formula: IR = VDD/2REXT (mA) with REXT in kΩ.

30	TmCL	MCLR Pulse Width (low)	100* 1	— —	— —	ns μs	VDD = 5.0V VDD = 5.0V (PIC16LV54A only)
31	Twdt	Watchdog Timer Time-out Period (No Prescaler)	9.0*	18*	30*	ms	VDD = 5.0V (Comm)
32	TDRT	Device Reset Timer Period	9.0*	18*	30*	ms	VDD = 5.0V (Comm)
34	TioZ	I/O Hi-impedance from MCLR Low	— —	— —	100* 1μs	ns —	(PIC16LV54A only)

\* These parameters are characterized but not tested.

† Data in the Typical ("Typ") column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

# PIC16C5X

---

NOTES:

**TABLE 17-1: EXTERNAL CLOCK TIMING REQUIREMENTS - PIC16C5X, PIC16CR5X**

<b>Standard Operating Conditions (unless otherwise specified)</b> Operating Temperature $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$ for commercial $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for extended							
Param No.	Symbol	Characteristic	Min	Typ†	Max	Units	Conditions
2	Tcy	Instruction Cycle Time <sup>(2)</sup>	—	4/FOSC	—	—	
3	TosL, TosH	Clock in (OSC1) Low or High Time	50*	—	—	ns	XT oscillator
			20*	—	—	ns	HS oscillator
			2.0*	—	—	μs	LP oscillator
4	TosR, TosF	Clock in (OSC1) Rise or Fall Time	—	—	25*	ns	XT oscillator
			—	—	25*	ns	HS oscillator
			—	—	50*	ns	LP oscillator

\* These parameters are characterized but not tested.

† Data in the Typical ("Typ") column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption.

When an external clock input is used, the "max" cycle time limit is "DC" (no clock) for all devices.

**2:** Instruction cycle period (Tcy) equals four times the input oscillator time base period.

# PIC16C5X

## 19.2 DC Characteristics: PIC16C54C/C55A/C56A/C57C/C58B-40 (Commercial)<sup>(1)</sup>

DC CHARACTERISTICS			Standard Operating Conditions (unless otherwise specified)				
			Operating Temperature 0°C ≤ TA ≤ +70°C for commercial				
Param No.	Symbol	Characteristic	Min	Typ†	Max	Units	Conditions
D030	VIL	<b>Input Low Voltage</b> I/O Ports MCLR (Schmitt Trigger) T0CKI (Schmitt Trigger) OSC1	VSS VSS VSS VSS	— — — —	0.8 0.15 VDD 0.15 VDD 0.2 VDD	V V V V	4.5V < VDD ≤ 5.5V HS, 20 MHz ≤ FOSC ≤ 40 MHz
D040	VIH	<b>Input High Voltage</b> I/O ports MCLR (Schmitt Trigger) T0CKI (Schmitt Trigger) OSC1	2.0 0.85 VDD 0.85 VDD 0.8 VDD	— — — —	VDD VDD VDD VDD	V V V V	4.5V < VDD ≤ 5.5V HS, 20 MHz ≤ FOSC ≤ 40 MHz
D050	VHYS	<b>Hysteresis of Schmitt Trigger inputs</b>	0.15 VDD*	—	—	V	
D060	IIL	<b>Input Leakage Current<sup>(2,3)</sup></b> I/O ports  MCLR MCLR T0CKI OSC1	-1.0 -5.0 — -3.0 -3.0	0.5 — 0.5 0.5 0.5	+1.0 +5.0 +3.0 +3.0 —	μA μA μA μA μA	<b>For VDD ≤ 5.5V:</b> VSS ≤ VPIN ≤ VDD, pin at hi-impedance VPIN = VSS + 0.25V VPIN = VDD VSS ≤ VPIN ≤ VDD VSS ≤ VPIN ≤ VDD, HS
D080	VOL	<b>Output Low Voltage</b> I/O ports	—	—	0.6	V	IOL = 8.7 mA, VDD = 4.5V
D090	VOH	<b>Output High Voltage<sup>(3)</sup></b> I/O ports	VDD - 0.7	—	—	V	IOH = -5.4 mA, VDD = 4.5V

\* These parameters are characterized but not tested.

† Data in the Typical ("Typ") column is based on characterization results at 25°C. This data is for design guidance only and is not tested.

- Note 1:** Device operation between 20 MHz to 40 MHz requires the following: VDD between 4.5V to 5.5V, OSC1 pin externally driven, OSC2 pin not connected and HS oscillator mode and commercial temperatures. For operation between DC and 20 MHz, See Section 17.3.
- 2:** The leakage current on the MCLR/VPP pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltage.
- 3:** Negative current is defined as coming out of the pin.

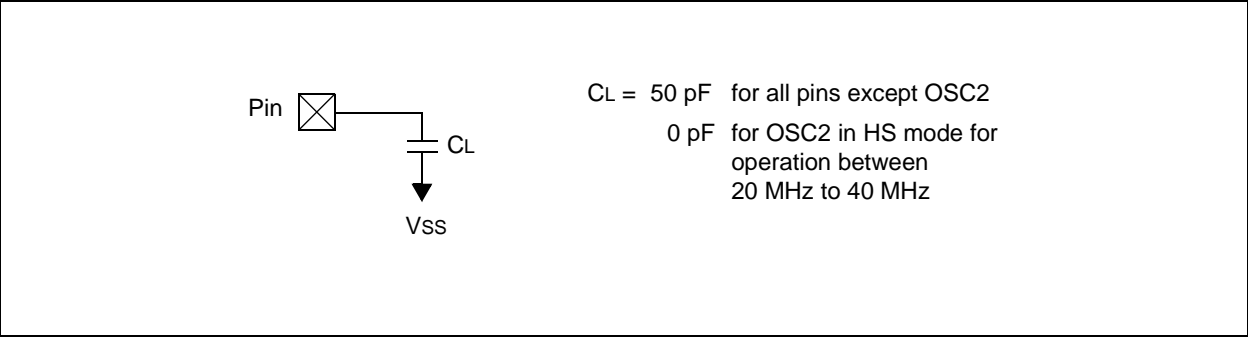

19.3 Timing Parameter Symbolology and Load Conditions

The timing parameter symbols have been created with one of the following formats:

- 1. TppS2ppS
- 2. TppS

T		T	Time
F	Frequency		
Lowercase letters (pp) and their meanings:			
pp		mc	MCLR
2	to	osc	oscillator
ck	CLKOUT	os	OSC1
cy	cycle time	t0	T0CKI
drt	device reset timer	wdt	watchdog timer
io	I/O port		
Uppercase letters and their meanings:			
S		P	Period
F	Fall	R	Rise
H	High	V	Valid
I	Invalid (Hi-impedance)	Z	Hi-impedance
L	Low

## ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web (WWW) site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

### Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

**[www.microchip.com](http://www.microchip.com)**

The file transfer site is available by using an FTP service to connect to:

**<ftp://ftp.microchip.com>**

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events
