Welcome to E-XFL.COM

Understanding <u>Embedded - FPGAs (Field</u> <u>Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	540
Number of Logic Elements/Cells	4320
Total RAM Bits	94208
Number of I/O	206
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-VFBGA
Supplier Device Package	256-CSFBGA (9x9)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo3l-4300e-5mg256c

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

MachXO3 Family Data Sheet Introduction

January 2016

Features

Solutions

- Smallest footprint, lowest power, high data throughput bridging solutions for mobile applications
- Optimized footprint, logic density, IO count, IO performance devices for IO management and logic applications
- High IO/logic, lowest cost/IO, high IO devices for IO expansion applications

■ Flexible Architecture

- Logic Density ranging from 640 to 9.4K LUT4
- High IO to LUT ratio with up to 384 IO pins

Advanced Packaging

- 0.4 mm pitch: 1K to 4K densities in very small footprint WLCSP (2.5 mm x 2.5 mm to 3.8 mm x 3.8 mm) with 28 to 63 IOs
- 0.5 mm pitch: 640 to 6.9K LUT densities in 6 mm x 6 mm to 10 mm x 10 mm BGA packages with up to 281 IOs
- 0.8 mm pitch: 1K to 9.4K densities with up to 384 IOs in BGA packages

Pre-Engineered Source Synchronous I/O

- DDR registers in I/O cells
- Dedicated gearing logic
- 7:1 Gearing for Display I/Os
- Generic DDR, DDRx2, DDRx4

High Performance, Flexible I/O Buffer

- Programmable sysIO[™] buffer supports wide range of interfaces:
 - LVCMOS 3.3/2.5/1.8/1.5/1.2
 - LVTTL
 - LVDS, Bus-LVDS, MLVDS, LVPECL
 - MIPI D-PHY Emulated
 - Schmitt trigger inputs, up to 0.5 V hysteresis
- Ideal for IO bridging applications
- I/Os support hot socketing
- On-chip differential termination
- Programmable pull-up or pull-down mode

■ Flexible On-Chip Clocking

- · Eight primary clocks
- Up to two edge clocks for high-speed I/O interfaces (top and bottom sides only)
- Up to two analog PLLs per device with fractional-n frequency synthesis
 - Wide input frequency range (7 MHz to 400 MHz)
- Non-volatile, Multi-time Programmable
 - Instant-on
 - Powers up in microseconds
 - · Optional dual boot with external SPI memory
 - Single-chip, secure solution
 - Programmable through JTAG, SPI or I²C
 - MachXO3L includes multi-time programmable
 NVCM
 - MachXO3LF infinitely reconfigurable Flash

 Supports background programming of non-volatile memory

TransFR Reconfiguration

In-field logic update while IO holds the system state

Enhanced System Level Support

- On-chip hardened functions: SPI, I²C, timer/ counter
- On-chip oscillator with 5.5% accuracy
- Unique TraceID for system tracking
- Single power supply with extended operating range
- IEEE Standard 1149.1 boundary scan
- IEEE 1532 compliant in-system programming

Applications

- Consumer Electronics
- Compute and Storage
- Wireless Communications
- Industrial Control Systems
- Automotive System

Low Cost Migration Path

- Migration from the Flash based MachXO3LF to the NVCM based MachXO3L
- · Pin compatible and equivalent timing

Advance Data Sheet DS1047

PFU Blocks

The core of the MachXO3L/LF device consists of PFU blocks, which can be programmed to perform logic, arithmetic, distributed RAM and distributed ROM functions. Each PFU block consists of four interconnected slices numbered 0 to 3 as shown in Figure 2-3. Each slice contains two LUTs and two registers. There are 53 inputs and 25 outputs associated with each PFU block.

Figure 2-3. PFU Block Diagram

Slices

Slices 0-3 contain two LUT4s feeding two registers. Slices 0-2 can be configured as distributed memory. Table 2-1 shows the capability of the slices in PFU blocks along with the operation modes they enable. In addition, each PFU contains logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7 and LUT8. The control logic performs set/reset functions (programmable as synchronous/ asynchronous), clock select, chip-select and wider RAM/ROM functions.

Table 2-1. Resources and Modes Available per Slice

	PFU	Block
Slice	Resources	Modes
Slice 0	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 1	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 2	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 3	2 LUT4s and 2 Registers	Logic, Ripple, ROM

Figure 2-4 shows an overview of the internal logic of the slice. The registers in the slice can be configured for positive/negative and edge triggered or level sensitive clocks. All slices have 15 inputs from routing and one from the carry-chain (from the adjacent slice or PFU). There are seven outputs: six for routing and one to carry-chain (to the adjacent PFU). Table 2-2 lists the signals associated with Slices 0-3.

Figure 2-6. Secondary High Fanout Nets for MachXO3L/LF Devices

sysCLOCK Phase Locked Loops (PLLs)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. All MachXO3L/LF devices have one or more sysCLOCK PLL. CLKI is the reference frequency input to the PLL and its source can come from an external I/O pin or from internal routing. CLKFB is the feedback signal to the PLL which can come from internal routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The MachXO3L/LF sysCLOCK PLLs support high resolution (16-bit) fractional-N synthesis. Fractional-N frequency synthesis allows the user to generate an output clock which is a non-integer multiple of the input frequency. For more information about using the PLL with Fractional-N synthesis, please see TN1282, MachXO3 sysCLOCK PLL Design and Usage Guide.

Each output has its own output divider, thus allowing the PLL to generate different frequencies for each output. The output dividers can have a value from 1 to 128. The output dividers may also be cascaded together to generate low frequency clocks. The CLKOP, CLKOS, CLKOS2, and CLKOS3 outputs can all be used to drive the MachXO3L/LF clock distribution network directly or general purpose routing resources can be used.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected. A block diagram of the PLL is shown in Figure 2-7.

The setup and hold times of the device can be improved by programming a phase shift into the CLKOS, CLKOS2, and CLKOS3 output clocks which will advance or delay the output clock with reference to the CLKOP output clock.

Figure 2-8. sysMEM Memory Primitives

Input Gearbox

Each PIC on the bottom edge has a built-in 1:8 input gearbox. Each of these input gearboxes may be programmed as a 1:7 de-serializer or as one IDDRX4 (1:8) gearbox or as two IDDRX2 (1:4) gearboxes. Table 2-9 shows the gearbox signals.

Table 2-9. Input Gearbox Signal List

Name	I/O Type	Description
D	Input	High-speed data input after programmable delay in PIO A input register block
ALIGNWD	Input	Data alignment signal from device core
SCLK	Input	Slow-speed system clock
ECLK[1:0]	Input	High-speed edge clock
RST	Input	Reset
Q[7:0]	Output	Low-speed data to device core: Video RX(1:7): Q[6:0] GDDRX4(1:8): Q[7:0] GDDRX2(1:4)(IOL-A): Q4, Q5, Q6, Q7 GDDRX2(1:4)(IOL-C): Q0, Q1, Q2, Q3

These gearboxes have three stage pipeline registers. The first stage registers sample the high-speed input data by the high-speed edge clock on its rising and falling edges. The second stage registers perform data alignment based on the control signals UPDATE and SEL0 from the control block. The third stage pipeline registers pass the data to the device core synchronized to the low-speed system clock. Figure 2-13 shows a block diagram of the input gearbox.

Output Gearbox

Each PIC on the top edge has a built-in 8:1 output gearbox. Each of these output gearboxes may be programmed as a 7:1 serializer or as one ODDRX4 (8:1) gearbox or as two ODDRX2 (4:1) gearboxes. Table 2-10 shows the gearbox signals.

Table 2-10. Output Gearbox Signal List

Name	I/O Type	Description
Q	Output	High-speed data output
D[7:0]	Input	Low-speed data from device core
Video TX(7:1): D[6:0]		
GDDRX4(8:1): D[7:0]		
GDDRX2(4:1)(IOL-A): D[3:0]		
GDDRX2(4:1)(IOL-C): D[7:4]		
SCLK	Input	Slow-speed system clock
ECLK [1:0]	Input	High-speed edge clock
RST	Input	Reset

The gearboxes have three stage pipeline registers. The first stage registers sample the low-speed input data on the low-speed system clock. The second stage registers transfer data from the low-speed clock registers to the high-speed clock registers. The third stage pipeline registers controlled by high-speed edge clock shift and mux the high-speed data out to the sysIO buffer. Figure 2-14 shows the output gearbox block diagram.

For more details on these embedded functions, please refer to TN1293, Using Hardened Control Functions in MachXO3 Devices.

User Flash Memory (UFM)

MachXO3LF devices provide a User Flash Memory block, which can be used for a variety of applications including storing a portion of the configuration image, initializing EBRs, to store PROM data or, as a general purpose user Flash memory. The UFM block connects to the device core through the embedded function block WISHBONE interface. Users can also access the UFM block through the JTAG, I2C and SPI interfaces of the device. The UFM block offers the following features:

- Non-volatile storage up to 256 kbits
- 100K write cycles
- Write access is performed page-wise; each page has 128 bits (16 bytes)
- Auto-increment addressing
- WISHBONE interface

For more information on the UFM, please refer to TN1293, Using Hardened Control Functions in MachXO3 Devices.

Standby Mode and Power Saving Options

MachXO3L/LF devices are available in two options, the C and E devices. The C devices have a built-in voltage regulator to allow for 2.5 V V_{CC} and 3.3 V V_{CC} while the E devices operate at 1.2 V V_{CC}.

MachXO3L/LF devices have been designed with features that allow users to meet the static and dynamic power requirements of their applications by controlling various device subsystems such as the bandgap, power-on-reset circuitry, I/O bank controllers, power guard, on-chip oscillator, PLLs, etc. In order to maximize power savings, MachXO3L/LF devices support a low power Stand-by mode.

In the stand-by mode the MachXO3L/LF devices are powered on and configured. Internal logic, I/Os and memories are switched on and remain operational, as the user logic waits for an external input. The device enters this mode when the standby input of the standby controller is toggled or when an appropriate I²C or JTAG instruction is issued by an external master. Various subsystems in the device such as the band gap, power-on-reset circuitry etc can be configured such that they are automatically turned "off" or go into a low power consumption state to save power when the device enters this state. Note that the MachXO3L/LF devices are powered on when in standby mode and all power supplies should remain in the Recommended Operating Conditions.

Configuration and Testing

This section describes the configuration and testing features of the MachXO3L/LF family.

IEEE 1149.1-Compliant Boundary Scan Testability

All MachXO3L/LF devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port shares its power supply with V_{CCIO} Bank 0 and can operate with LVCMOS3.3, 2.5, 1.8, 1.5, and 1.2 standards.

For more details on boundary scan test, see AN8066, Boundary Scan Testability with Lattice sysIO Capability and TN1087, Minimizing System Interruption During Configuration Using TransFR Technology.

Device Configuration

All MachXO3L/LF devices contain two ports that can be used for device configuration. The Test Access Port (TAP), which supports bit-wide configuration and the sysCONFIG port which supports serial configuration through I²C or SPI. The TAP supports both the IEEE Standard 1149.1 Boundary Scan specification and the IEEE Standard 1532 In-System Configuration specification. There are various ways to configure a MachXO3L/LF device:

- 1. Internal NVCM/Flash Download
- 2. JTAG
- 3. Standard Serial Peripheral Interface (Master SPI mode) interface to boot PROM memory
- 4. System microprocessor to drive a serial slave SPI port (SSPI mode)
- 5. Standard I²C Interface to system microprocessor

Upon power-up, the configuration SRAM is ready to be configured using the selected sysCONFIG port. Once a configuration port is selected, it will remain active throughout that configuration cycle. The IEEE 1149.1 port can be activated any time after power-up by sending the appropriate command through the TAP port. Optionally the device can run a CRC check upon entering the user mode. This will ensure that the device was configured correctly.

The sysCONFIG port has 10 dual-function pins which can be used as general purpose I/Os if they are not required for configuration. See TN1279, MachXO3 Programming and Configuration Usage Guide for more information about using the dual-use pins as general purpose I/Os.

Lattice design software uses proprietary compression technology to compress bit-streams for use in MachXO3L/ LF devices. Use of this technology allows Lattice to provide a lower cost solution. In the unlikely event that this technology is unable to compress bitstreams to fit into the amount of on-chip NVCM/Flash, there are a variety of techniques that can be utilized to allow the bitstream to fit in the on-chip NVCM/Flash. For more details, refer to TN1279, MachXO3 Programming and Configuration Usage Guide.

The Test Access Port (TAP) has five dual purpose pins (TDI, TDO, TMS, TCK and JTAGENB). These pins are dual function pins - TDI, TDO, TMS and TCK can be used as general purpose I/O if desired. For more details, refer to TN1279, MachXO3 Programming and Configuration Usage Guide.

TransFR (Transparent Field Reconfiguration)

TransFR is a unique Lattice technology that allows users to update their logic in the field without interrupting system operation using a simple push-button solution. For more details refer to TN1087, Minimizing System Interruption During Configuration Using TransFR Technology for details.

t _{ROTATE_WD}	PHASESTEP Pulse Width		4	—	VCO Cycles

Over Recommended Operating Conditions

1. Period jitter sample is taken over 10,000 samples of the primary PLL output with a clean reference clock. Cycle-to-cycle jitter is taken over 1000 cycles. Phase jitter is taken over 2000 cycles. All values per JESD65B.

2. Output clock is valid after t_{LOCK} for PLL reset and dynamic delay adjustment.

3. Using LVDS output buffers.

4. CLKOS as compared to CLKOP output for one phase step at the maximum VCO frequency. See TN1282, MachXO3 sysCLOCK PLL Design and Usage Guide for more details.

5. At minimum $\rm f_{PFD}$ As the $\rm f_{PFD}$ increases the time will decrease to approximately 60% the value listed.

6. Maximum allowed jitter on an input clock. PLL unlock may occur if the input jitter exceeds this specification. Jitter on the input clock may be transferred to the output clocks, resulting in jitter measurements outside the output specifications listed in this table.

7. Edge Duty Trim Accuracy is a percentage of the setting value. Settings available are 70 ps, 140 ps, and 280 ps in addition to the default value of none.

8. Jitter values measured with the internal oscillator operating. The jitter values will increase with loading of the PLD fabric and in the presence of SSO noise.

I²C Port Timing Specifications^{1, 2}

Symbol	Parameter	Min.	Max.	Units
f _{MAX}	Maximum SCL clock frequency		400	kHz

1. MachXO3L/LF supports the following modes:

• Standard-mode (Sm), with a bit rate up to 100 kbit/s (user and configuration mode)

• Fast-mode (Fm), with a bit rate up to 400 kbit/s (user and configuration mode)

2. Refer to the I^2C specification for timing requirements.

SPI Port Timing Specifications¹

Symbol	Parameter	Min.	Max.	Units
f _{MAX}	Maximum SCK clock frequency		45	MHz

1. Applies to user mode only. For configuration mode timing specifications, refer to sysCONFIG Port Timing Specifications table in this data sheet.

Switching Test Conditions

Figure 3-9 shows the output test load used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3-6.

Figure 3-9. Output Test Load, LVTTL and LVCMOS Standards

Table 3-6. Test Fixture Required Components	, Non-Terminated Interfaces
---	-----------------------------

Test Condition	R1	CL	Timing Ref.	VT

MachXO3 Family Data Sheet Revision History

February 2017

Advance Data Sheet DS1047

Date	Version	Section	Change Summary
February 2017	ebruary 2017 1.8 Archited		Updated Supported Standards section. Corrected "MDVS" to "MLDVS" in Table 2-11, Supported Input Standards.
		DC and Switching Characteristics	Updated ESD Performance section. Added reference to the MachXO2 Product Family Qualification Summary document.
			Updated Static Supply Current – C/E Devices section. Added footnote 7.
			Updated MachXO3L/LF External Switching Characteristics – C/E Devices section. — Populated values for MachXO3L/LF-9400. — Under 7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1, corrected "t _{DVB} " to "t _{DIB} " and "t _{DVA} " to "t _{DIA} " and revised their descriptions. — Added Figure 3-6, Receiver GDDR71_RX Waveforms and Figure 3-7, Transmitter GDDR71_TX Waveforms.
		Pinout Information	Updated the Pin Information Summary section. Added MachXO3L/LF- 9600C packages.
May 2016	1.7	DC and Switching Characteristics	Updated Absolute Maximum Ratings section. Modified I/O Tri-state Volt- age Applied and Dedicated Input Voltage Applied footnotes.
			Updated sysIO Recommended Operating Conditions section. — Added standards. — Added V _{REF} (V) — Added footnote 4.
			Updated sysIO Single-Ended DC Electrical Characteristics section. Added I/O standards.
		Ordering Information	Updated MachXO3L Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added LCMXO3L-9400C part numbers.
			Updated MachXO3LF Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added LCMXO3L-9400C part numbers.

Date	Version	Section	Change Summary
June 2014	1.0	—	Product name/trademark adjustment.
		Introduction	Updated Features section.
			Updated Table 1-1, MachXO3L Family Selection Guide. Changed fcCSP packages to csfBGA. Adjusted 121-ball csfBGA arrow.
			Introduction section general update.
		Architecture	General update.
		DC and Switching Characteristics	Updated sysIO Recommended Operating Conditions section. Removed V _{REF} (V) column. Added standards.
			Updated Maximum sysIO Buffer Performance section. Added MIPI I/O standard.
			Updated MIPI D-PHY Emulation section. Changed Low Speed to Low Power. Updated Table 3-4, MIPI DC Conditions.
			Updated Table 3-5, MIPI D-PHY Output DC Conditions.
			Updated Maximum sysIO Buffer Performance section.
			Updated MachXO3L External Switching Characteristics – C/E Device section.
May 2014	00.3	Introduction	Updated Features section.
			Updated Table 1-1, MachXO3L Family Selection Guide. Moved 121-ball fcCSP arrow.
			General update of Introduction section.
		Architecture	General update.
		Pinout Information	Updated Pin Information Summary section. Updated or added data on WLCSP49, WLCSP81, CABGA324, and CABGA400 for specific devices.
		Ordering Information	Updated MachXO3L Part Number Description section. Updated or added data on WLCSP49, WLCSP81, CABGA324, and CABGA400 for specific devices.
			Updated Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added part numbers.
February 2014	00.2	DC and Switching Characteristics	Updated MachXO3L External Switching Characteristics – C/E Devices table. Removed LPDDR and DDR2 parameters.
	00.1	_	Initial release.
