

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	858
Number of Logic Elements/Cells	6864
Total RAM Bits	245760
Number of I/O	279
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	324-LFBGA
Supplier Device Package	324-CABGA (15x15)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo3l-6900c-6bg324c

Figure 2-2. Top View of the MachXO3L/LF-4300 Device

Notes:

- MachXO3L/LF-1300, MachXO3L/LF-2100, MachXO3L/LF-6900 and MachXO3L/LF-9400 are similar to MachXO3L/LF-4300. MachXO3L/LF-1300 has a lower LUT count, one PLL, and seven EBR blocks. MachXO3L/LF-2100 has a lower LUT count, one PLL, and eight EBR blocks. MachXO3L/LF-6900 has a higher LUT count, two PLLs, and 26 EBR blocks. MachXO3L/LF-9400 has a higher LUT count, two PLLs, and 48 EBR blocks.
- MachXO3L devices have NVCM, MachXO3LF devices have Flash.

The logic blocks, Programmable Functional Unit (PFU) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each row has either the logic blocks or the EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the MachXO3L/LF family, the number of sysIO banks varies by device. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag “hard” control logic to minimize LUT usage.

The MachXO3L/LF registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

The MachXO3L/LF architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks. These blocks are located at the ends of the on-chip NVCM/Flash block. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

MachXO3L/LF devices provide commonly used hardened functions such as SPI controller, I²C controller and timer/counter.

MachXO3LF devices also provide User Flash Memory (UFM). These hardened functions and the UFM interface to the core logic and routing through a WISHBONE interface. The UFM can also be accessed through the SPI, I²C and JTAG ports.

Every device in the family has a JTAG port that supports programming and configuration of the device as well as access to the user logic. The MachXO3L/LF devices are available for operation from 3.3 V, 2.5 V and 1.2 V power supplies, providing easy integration into the overall system.

Figure 2-6. Secondary High Fanout Nets for MachXO3L/LF Devices

sysCLOCK Phase Locked Loops (PLLs)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. All MachXO3L/LF devices have one or more sysCLOCK PLL. CLKI is the reference frequency input to the PLL and its source can come from an external I/O pin or from internal routing. CLKFB is the feedback signal to the PLL which can come from internal routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The MachXO3L/LF sysCLOCK PLLs support high resolution (16-bit) fractional-N synthesis. Fractional-N frequency synthesis allows the user to generate an output clock which is a non-integer multiple of the input frequency. For more information about using the PLL with Fractional-N synthesis, please see TN1282, [MachXO3 sysCLOCK PLL Design and Usage Guide](#).

Each output has its own output divider, thus allowing the PLL to generate different frequencies for each output. The output dividers can have a value from 1 to 128. The output dividers may also be cascaded together to generate low frequency clocks. The CLKOP, CLKOS, CLKOS2, and CLKOS3 outputs can all be used to drive the MachXO3L/LF clock distribution network directly or general purpose routing resources can be used.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected. A block diagram of the PLL is shown in Figure 2-7.

The setup and hold times of the device can be improved by programming a phase shift into the CLKOS, CLKOS2, and CLKOS3 output clocks which will advance or delay the output clock with reference to the CLKOP output clock.

Table 2-6. EBR Signal Descriptions

Port Name	Description	Active State
CLK	Clock	Rising Clock Edge
CE	Clock Enable	Active High
OCE ¹	Output Clock Enable	Active High
RST	Reset	Active High
BE ¹	Byte Enable	Active High
WE	Write Enable	Active High
AD	Address Bus	—
DI	Data In	—
DO	Data Out	—
CS	Chip Select	Active High
AFF	FIFO RAM Almost Full Flag	—
FF	FIFO RAM Full Flag	—
AEF	FIFO RAM Almost Empty Flag	—
EF	FIFO RAM Empty Flag	—
RPRST	FIFO RAM Read Pointer Reset	—

- Optional signals.
- For dual port EBR primitives a trailing 'A' or 'B' in the signal name specifies the EBR port A or port B respectively.
- For FIFO RAM mode primitive, a trailing 'R' or 'W' in the signal name specifies the FIFO read port or write port respectively.
- For FIFO RAM mode primitive FULLI has the same function as CSW(2) and EMPTYI has the same function as CSR(2).
- In FIFO mode, CLKW is the write port clock, CSW is the write port chip select, CLKR is the read port clock, CSR is the read port chip select, ORE is the output read enable.

The EBR memory supports three forms of write behavior for single or dual port operation:

- Normal** – Data on the output appears only during the read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
- Write Through** – A copy of the input data appears at the output of the same port. This mode is supported for all data widths.
- Read-Before-Write** – When new data is being written, the old contents of the address appears at the output.

FIFO Configuration

The FIFO has a write port with data-in, CEW, WE and CLKW signals. There is a separate read port with data-out, RCE, RE and CLKR signals. The FIFO internally generates Almost Full, Full, Almost Empty and Empty Flags. The Full and Almost Full flags are registered with CLKW. The Empty and Almost Empty flags are registered with CLKR. Table 2-7 shows the range of programming values for these flags.

Table 2-7. Programmable FIFO Flag Ranges

Flag Name	Programming Range
Full (FF)	1 to max (up to 2^N-1)
Almost Full (AF)	1 to Full-1
Almost Empty (AE)	1 to Full-1
Empty (EF)	0

N = Address bit width.

The FIFO state machine supports two types of reset signals: RST and RPRST. The RST signal is a global reset that clears the contents of the FIFO by resetting the read/write pointer and puts the FIFO flags in their initial reset

PIO

The PIO contains three blocks: an input register block, output register block and tri-state register block. These blocks contain registers for operating in a variety of modes along with the necessary clock and selection logic.

Table 2-8. PIO Signal List

Pin Name	I/O Type	Description
CE	Input	Clock Enable
D	Input	Pin input from sysIO buffer.
INDD	Output	Register bypassed input.
INCK	Output	Clock input
Q0	Output	DDR positive edge input
Q1	Output	Registered input/DDR negative edge input
D0	Input	Output signal from the core (SDR and DDR)
D1	Input	Output signal from the core (DDR)
TD	Input	Tri-state signal from the core
Q	Output	Data output signals to sysIO Buffer
TQ	Output	Tri-state output signals to sysIO Buffer
SCLK	Input	System clock for input and output/tri-state blocks.
RST	Input	Local set reset signal

Input Register Block

The input register blocks for the PIOs on all edges contain delay elements and registers that can be used to condition high-speed interface signals before they are passed to the device core.

Left, Top, Bottom Edges

Input signals are fed from the sysIO buffer to the input register block (as signal D). If desired, the input signal can bypass the register and delay elements and be used directly as a combinatorial signal (INDD), and a clock (INCK). If an input delay is desired, users can select a fixed delay. I/Os on the bottom edge also have a dynamic delay, DEL[4:0]. The delay, if selected, reduces input register hold time requirements when using a global clock. The input block allows two modes of operation. In single data rate (SDR) the data is registered with the system clock (SCLK) by one of the registers in the single data rate sync register block. In Generic DDR mode, two registers are used to sample the data on the positive and negative edges of the system clock (SCLK) signal, creating two data streams.

Output Gearbox

Each PIC on the top edge has a built-in 8:1 output gearbox. Each of these output gearboxes may be programmed as a 7:1 serializer or as one ODDR4 (8:1) gearbox or as two ODDR2 (4:1) gearboxes. Table 2-10 shows the gearbox signals.

Table 2-10. Output Gearbox Signal List

Name	I/O Type	Description
Q	Output	High-speed data output
D[7:0]	Input	Low-speed data from device core
Video TX(7:1): D[6:0]		
GDDR4(8:1): D[7:0]		
GDDR2(4:1)(IOL-A): D[3:0]		
GDDR2(4:1)(IOL-C): D[7:4]		
SCLK	Input	Slow-speed system clock
ECLK [1:0]	Input	High-speed edge clock
RST	Input	Reset

The gearboxes have three stage pipeline registers. The first stage registers sample the low-speed input data on the low-speed system clock. The second stage registers transfer data from the low-speed clock registers to the high-speed clock registers. The third stage pipeline registers controlled by high-speed edge clock shift and mux the high-speed data out to the sysIO buffer. Figure 2-14 shows the output gearbox block diagram.

Figure 2-14. Output Gearbox

More information on the output gearbox is available in TN1281, [Implementing High-Speed Interfaces with MachXO3 Devices](#).

Embedded Hardened IP Functions

All MachXO3L/LF devices provide embedded hardened functions such as SPI, I²C and Timer/Counter. MachXO3LF devices also provide User Flash Memory (UFM). These embedded blocks interface through the WISHBONE interface with routing as shown in Figure 2-17.

Figure 2-17. Embedded Function Block Interface

Hardened I²C IP Core

Every MachXO3L/LF device contains two I²C IP cores. These are the primary and secondary I²C IP cores. Either of the two cores can be configured either as an I²C master or as an I²C slave. The only difference between the two IP cores is that the primary core has pre-assigned I/O pins whereas users can assign I/O pins for the secondary core.

When the IP core is configured as a master it will be able to control other devices on the I²C bus through the interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I²C Master. The I²C cores support the following functionality:

- Master and Slave operation
- 7-bit and 10-bit addressing
- Multi-master arbitration support
- Up to 400 kHz data transfer speed
- General call support
- Interface to custom logic through 8-bit WISHBONE interface

There are some limitations on the use of the hardened user SPI. These are defined in the following technical notes:

- TN1087, [Minimizing System Interruption During Configuration Using TransFR Technology](#) (Appendix B)
- TN1293, [Using Hardened Control Functions in MachXO3 Devices](#)

Figure 2-19. SPI Core Block Diagram

Table 2-15 describes the signals interfacing with the SPI cores.

Table 2-15. SPI Core Signal Description

Signal Name	I/O	Master/Slave	Description
spi_csn[0]	O	Master	SPI master chip-select output
spi_csn[1..7]	O	Master	Additional SPI chip-select outputs (total up to eight slaves)
spi_scsn	I	Slave	SPI slave chip-select input
spi_irq	O	Master/Slave	Interrupt request
spi_clk	I/O	Master/Slave	SPI clock. Output in master mode. Input in slave mode.
spi_miso	I/O	Master/Slave	SPI data. Input in master mode. Output in slave mode.
spi_mosi	I/O	Master/Slave	SPI data. Output in master mode. Input in slave mode.
sn	I	Slave	Configuration Slave Chip Select (active low), dedicated for selecting the Configuration Logic.
cfg_stdbv	O	Master/Slave	Stand-by signal – To be connected only to the power module of the MachXO3L/LF device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, SPI Tab.
cfg_wake	O	Master/Slave	Wake-up signal – To be connected only to the power module of the MachXO3L/LF device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, SPI Tab.

DC Electrical Characteristics

Over Recommended Operating Conditions

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$I_{IL}, I_{IH}^{1,4}$	Input or I/O Leakage	Clamp OFF and $V_{CCIO} < V_{IN} < V_{IH} (MAX)$	—	—	+175	μA
		Clamp OFF and $V_{IN} = V_{CCIO}$	-10	—	10	μA
		Clamp OFF and $V_{CCIO} - 0.97 V < V_{IN} < V_{CCIO}$	-175	—	—	μA
		Clamp OFF and $0 V < V_{IN} < V_{CCIO} - 0.97 V$	—	—	10	μA
		Clamp OFF and $V_{IN} = GND$	—	—	10	μA
		Clamp ON and $0 V < V_{IN} < V_{CCIO}$	—	—	10	μA
I_{PU}	I/O Active Pull-up Current	$0 < V_{IN} < 0.7 V_{CCIO}$	-30	—	-309	μA
I_{PD}	I/O Active Pull-down Current	$V_{IL} (MAX) < V_{IN} < V_{CCIO}$	30	—	305	μA
I_{BHLS}	Bus Hold Low sustaining current	$V_{IN} = V_{IL} (MAX)$	30	—	—	μA
I_{BHHS}	Bus Hold High sustaining current	$V_{IN} = 0.7V_{CCIO}$	-30	—	—	μA
I_{BHLO}	Bus Hold Low Overdrive current	$0 \leq V_{IN} \leq V_{CCIO}$	—	—	305	μA
I_{BHHO}	Bus Hold High Overdrive current	$0 \leq V_{IN} \leq V_{CCIO}$	—	—	-309	μA
V_{BHT}^3	Bus Hold Trip Points		$V_{IL} (MAX)$	—	$V_{IH} (MIN)$	V
C1	I/O Capacitance ²	$V_{CCIO} = 3.3 V, 2.5 V, 1.8 V, 1.5 V, 1.2 V, V_{CC} = Typ., V_{IO} = 0 \text{ to } V_{IH} (MAX)$	3	5	9	pf
C2	Dedicated Input Capacitance ²	$V_{CCIO} = 3.3 V, 2.5 V, 1.8 V, 1.5 V, 1.2 V, V_{CC} = Typ., V_{IO} = 0 \text{ to } V_{IH} (MAX)$	3	5.5	7	pf
V_{HYST}	Hysteresis for Schmitt Trigger Inputs ⁵	$V_{CCIO} = 3.3 V, \text{Hysteresis} = \text{Large}$	—	450	—	mV
		$V_{CCIO} = 2.5 V, \text{Hysteresis} = \text{Large}$	—	250	—	mV
		$V_{CCIO} = 1.8 V, \text{Hysteresis} = \text{Large}$	—	125	—	mV
		$V_{CCIO} = 1.5 V, \text{Hysteresis} = \text{Large}$	—	100	—	mV
		$V_{CCIO} = 3.3 V, \text{Hysteresis} = \text{Small}$	—	250	—	mV
		$V_{CCIO} = 2.5 V, \text{Hysteresis} = \text{Small}$	—	150	—	mV
		$V_{CCIO} = 1.8 V, \text{Hysteresis} = \text{Small}$	—	60	—	mV
		$V_{CCIO} = 1.5 V, \text{Hysteresis} = \text{Small}$	—	40	—	mV

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. $T_A = 25^\circ C$, $f = 1.0 \text{ MHz}$.
3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.
4. When V_{IH} is higher than V_{CCIO} , a transient current typically of 30 ns in duration or less with a peak current of 6mA can occur on the high-to-low transition. For true LVDS output pins in MachXO3L/LF devices, V_{IH} must be less than or equal to V_{CCIO} .
5. With bus keeper circuit turned on. For more details, refer to TN1280, [MachXO3 sysIO Usage Guide](#).

Static Supply Current – C/E Devices^{1, 2, 3, 6}

Symbol	Parameter	Device	Typ. ⁴	Units
I _{CC}	Core Power Supply	LCMXO3L/LF-1300C 256 Ball Package	4.8	mA
		LCMXO3L/LF-2100C	4.8	mA
		LCMXO3L/LF-2100C 324 Ball Package	8.45	mA
		LCMXO3L/LF-4300C	8.45	mA
		LCMXO3L/LF-4300C 400 Ball Package	12.87	mA
		LCMXO3L/LF-6900C ⁷	12.87	mA
		LCMXO3L/LF-9400C ⁷	17.86	mA
		LCMXO3L/LF-640E	1.00	mA
		LCMXO3L/LF-1300E	1.00	mA
		LCMXO3L/LF-1300E 256 Ball Package	1.39	mA
		LCMXO3L/LF-2100E	1.39	mA
		LCMXO3L/LF-2100E 324 Ball Package	2.55	mA
		LCMXO3L/LF-4300E	2.55	mA
		LCMXO3L/LF-6900E	4.06	mA
		LCMXO3L/LF-9400E	5.66	mA
I _{CCIO}	Bank Power Supply ⁵ V _{CCIO} = 2.5 V	All devices	0	mA

1. For further information on supply current, please refer to TN1289, [Power Estimation and Management for MachXO3 Devices](#).

2. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip oscillator is off, on-chip PLL is off.

3. Frequency = 0 MHz.

4. T_J = 25 °C, power supplies at nominal voltage.

5. Does not include pull-up/pull-down.

6. To determine the MachXO3L/LF peak start-up current data, use the Power Calculator tool.

7. Determination of safe ambient operating conditions requires use of the Diamond Power Calculator tool.

Programming and Erase Supply Current – C/E Devices^{1, 2, 3, 4}

Symbol	Parameter	Device	Typ. ⁴	Units
I _{CC}	Core Power Supply	LCMXO3L/LF-1300C 256 Ball Package	22.1	mA
		LCMXO3L/LF-2100C	22.1	mA
		LCMXO3L/LF-2100C 324 Ball Package	26.8	mA
		LCMXO3L/LF-4300C	26.8	mA
		LCMXO3L/LF-4300C 400 Ball Package	33.2	mA
		LCMXO3L/LF-6900C	33.2	mA

		LCMXO3L/LF-4300E	20.4	mA
		LCMXO3L/LF-6900E	23.9	mA
		LCMXO3L/LF-9400E	28.5	mA
I _{CCIO}	Bank Power Supply ⁵ V _{CCIO} = 2.5 V	All devices	0	mA

1. For further information on supply current, please refer to TN1289, [Power Estimation and Management for MachXO3 Devices](#).

2. Assumes all inputs are held at V_{CCIO} or GND and all outputs are tri-stated.

3. Typical user pattern.

4. JTAG programming is at 25 MHz.

5. T_J = 25 °C, power supplies at nominal voltage.

6. Per bank. V_{CCIO} = 2.5 V. Does not include pull-up/pull-down.

LVDS Emulation

MachXO3L/LF devices can support LVDS outputs via emulation (LVDS25E). The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all devices. The scheme shown in Figure 3-1 is one possible solution for LVDS standard implementation. Resistor values in Figure 3-1 are industry standard values for 1% resistors.

Figure 3-1. LVDS Using External Resistors (LVDS25E)

Table 3-1. LVDS25E DC Conditions

Over Recommended Operating Conditions

Parameter	Description	Typ.	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	158	Ohms
