

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	858
Number of Logic Elements/Cells	6864
Total RAM Bits	245760
Number of I/O	281
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	324-VFBGA
Supplier Device Package	324-CSFBGA (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmx03l-6900e-6mg324c

Features

■ Solutions

- Smallest footprint, lowest power, high data throughput bridging solutions for mobile applications
- Optimized footprint, logic density, IO count, IO performance devices for IO management and logic applications
- High IO/logic, lowest cost/IO, high IO devices for IO expansion applications

■ Flexible Architecture

- Logic Density ranging from 640 to 9.4K LUT4
- High IO to LUT ratio with up to 384 IO pins

■ Advanced Packaging

- 0.4 mm pitch: 1K to 4K densities in very small footprint WLCSP (2.5 mm x 2.5 mm to 3.8 mm x 3.8 mm) with 28 to 63 IOs
- 0.5 mm pitch: 640 to 6.9K LUT densities in 6 mm x 6 mm to 10 mm x 10 mm BGA packages with up to 281 IOs
- 0.8 mm pitch: 1K to 9.4K densities with up to 384 IOs in BGA packages

■ Pre-Engineered Source Synchronous I/O

- DDR registers in I/O cells
- Dedicated gearing logic
- 7:1 Gearing for Display I/Os
- Generic DDR, DDRx2, DDRx4

■ High Performance, Flexible I/O Buffer

- Programmable sysIO™ buffer supports wide range of interfaces:
 - LVCMOS 3.3/2.5/1.8/1.5/1.2
 - LVTTTL
 - LVDS, Bus-LVDS, MLVDS, LVPECL
 - MIPI D-PHY Emulated
 - Schmitt trigger inputs, up to 0.5 V hysteresis
- Ideal for IO bridging applications
- I/Os support hot socketing
- On-chip differential termination
- Programmable pull-up or pull-down mode

■ Flexible On-Chip Clocking

- Eight primary clocks
- Up to two edge clocks for high-speed I/O interfaces (top and bottom sides only)
- Up to two analog PLLs per device with fractional-n frequency synthesis
 - Wide input frequency range (7 MHz to 400 MHz)

■ Non-volatile, Multi-time Programmable

- Instant-on
 - Powers up in microseconds
- Optional dual boot with external SPI memory
- Single-chip, secure solution
- Programmable through JTAG, SPI or I²C
- MachXO3L includes multi-time programmable NVCM
- MachXO3LF infinitely reconfigurable Flash
 - Supports background programming of non-volatile memory

■ TransFR Reconfiguration

- In-field logic update while IO holds the system state

■ Enhanced System Level Support

- On-chip hardened functions: SPI, I²C, timer/counter
- On-chip oscillator with 5.5% accuracy
- Unique TraceID for system tracking
- Single power supply with extended operating range
- IEEE Standard 1149.1 boundary scan
- IEEE 1532 compliant in-system programming

■ Applications

- Consumer Electronics
- Compute and Storage
- Wireless Communications
- Industrial Control Systems
- Automotive System

■ Low Cost Migration Path

- Migration from the Flash based MachXO3LF to the NVCM based MachXO3L
- Pin compatible and equivalent timing

Architecture Overview

The MachXO3L/LF family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). All logic density devices in this family have sysCLOCK™ PLLs and blocks of sysMEM Embedded Block RAM (EBRs). Figure 2-1 and Figure 2-2 show the block diagrams of the various family members.

Figure 2-1. Top View of the MachXO3L/LF-1300 Device

Notes:

- MachXO3L/LF-640 is similar to MachXO3L/LF-1300. MachXO3L/LF-640 has a lower LUT count.
- MachXO3L devices have NVCM, MachXO3LF devices have Flash.

Figure 2-2. Top View of the MachXO3L/LF-4300 Device

Notes:

- MachXO3L/LF-1300, MachXO3L/LF-2100, MachXO3L/LF-6900 and MachXO3L/LF-9400 are similar to MachXO3L/LF-4300. MachXO3L/LF-1300 has a lower LUT count, one PLL, and seven EBR blocks. MachXO3L/LF-2100 has a lower LUT count, one PLL, and eight EBR blocks. MachXO3L/LF-6900 has a higher LUT count, two PLLs, and 26 EBR blocks. MachXO3L/LF-9400 has a higher LUT count, two PLLs, and 48 EBR blocks.
- MachXO3L devices have NVCM, MachXO3LF devices have Flash.

The logic blocks, Programmable Functional Unit (PFU) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each row has either the logic blocks or the EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the MachXO3L/LF family, the number of sysIO banks varies by device. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag “hard” control logic to minimize LUT usage.

The MachXO3L/LF registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

The MachXO3L/LF architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks. These blocks are located at the ends of the on-chip NVCM/Flash block. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

MachXO3L/LF devices provide commonly used hardened functions such as SPI controller, I²C controller and timer/counter.

MachXO3LF devices also provide User Flash Memory (UFM). These hardened functions and the UFM interface to the core logic and routing through a WISHBONE interface. The UFM can also be accessed through the SPI, I²C and JTAG ports.

Every device in the family has a JTAG port that supports programming and configuration of the device as well as access to the user logic. The MachXO3L/LF devices are available for operation from 3.3 V, 2.5 V and 1.2 V power supplies, providing easy integration into the overall system.

PFU Blocks

The core of the MachXO3L/LF device consists of PFU blocks, which can be programmed to perform logic, arithmetic, distributed RAM and distributed ROM functions. Each PFU block consists of four interconnected slices numbered 0 to 3 as shown in Figure 2-3. Each slice contains two LUTs and two registers. There are 53 inputs and 25 outputs associated with each PFU block.

Figure 2-3. PFU Block Diagram

Slices

Slices 0-3 contain two LUT4s feeding two registers. Slices 0-2 can be configured as distributed memory. Table 2-1 shows the capability of the slices in PFU blocks along with the operation modes they enable. In addition, each PFU contains logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7 and LUT8. The control logic performs set/reset functions (programmable as synchronous/ asynchronous), clock select, chip-select and wider RAM/ROM functions.

Table 2-1. Resources and Modes Available per Slice

Slice	PFU Block	
	Resources	Modes
Slice 0	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 1	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 2	2 LUT4s and 2 Registers	Logic, Ripple, RAM, ROM
Slice 3	2 LUT4s and 2 Registers	Logic, Ripple, ROM

Figure 2-4 shows an overview of the internal logic of the slice. The registers in the slice can be configured for positive/negative and edge triggered or level sensitive clocks. All slices have 15 inputs from routing and one from the carry-chain (from the adjacent slice or PFU). There are seven outputs: six for routing and one to carry-chain (to the adjacent PFU). Table 2-2 lists the signals associated with Slices 0-3.

Figure 2-6. Secondary High Fanout Nets for MachXO3L/LF Devices

sysCLOCK Phase Locked Loops (PLLs)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. All MachXO3L/LF devices have one or more sysCLOCK PLL. CLKI is the reference frequency input to the PLL and its source can come from an external I/O pin or from internal routing. CLKFB is the feedback signal to the PLL which can come from internal routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The MachXO3L/LF sysCLOCK PLLs support high resolution (16-bit) fractional-N synthesis. Fractional-N frequency synthesis allows the user to generate an output clock which is a non-integer multiple of the input frequency. For more information about using the PLL with Fractional-N synthesis, please see TN1282, [MachXO3 sysCLOCK PLL Design and Usage Guide](#).

Each output has its own output divider, thus allowing the PLL to generate different frequencies for each output. The output dividers can have a value from 1 to 128. The output dividers may also be cascaded together to generate low frequency clocks. The CLKOP, CLKOS, CLKOS2, and CLKOS3 outputs can all be used to drive the MachXO3L/LF clock distribution network directly or general purpose routing resources can be used.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected. A block diagram of the PLL is shown in Figure 2-7.

The setup and hold times of the device can be improved by programming a phase shift into the CLKOS, CLKOS2, and CLKOS3 output clocks which will advance or delay the output clock with reference to the CLKOP output clock.

Table 2-5. sysMEM Block Configurations

Memory Mode	Configurations
Single Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9
True Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9
Pseudo Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18
FIFO	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18

Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1, and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. EBR initialization data can be loaded from the NVCM or Configuration Flash.

MachXO3LF EBR initialization data can also be loaded from the UFM. To maximize the number of UFM bits, initialize the EBRs used in your design to an all-zero pattern. Initializing to an all-zero pattern does not use up UFM bits. MachXO3LF devices have been designed such that multiple EBRs share the same initialization memory space if they are initialized to the same pattern.

By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Memory Cascading

Larger and deeper blocks of RAM can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual, Pseudo-Dual Port and FIFO Modes

Figure 2-8 shows the five basic memory configurations and their input/output names. In all the sysMEM RAM modes, the input data and addresses for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the memory array output.

state. The RPRST signal is used to reset the read pointer. The purpose of this reset is to retransmit the data that is in the FIFO. In these applications it is important to keep careful track of when a packet is written into or read from the FIFO.

Memory Core Reset

The memory core contains data output latches for ports A and B. These are simple latches that can be reset synchronously or asynchronously. RSTA and RSTB are local signals, which reset the output latches associated with port A and port B respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-9.

Figure 2-9. Memory Core Reset

For further information on the sysMEM EBR block, please refer to TN1290, [Memory Usage Guide for MachXO3 Devices](#).

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-10. The GSR input to the EBR is always asynchronous.

Figure 2-10. EBR Asynchronous Reset (Including GSR) Timing Diagram

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/t_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device wake up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-10. The reset timing rules apply to the RPRreset input versus the RE input and the RST input versus the WE and RE inputs. Both RST and RPRreset are always asynchronous EBR inputs. For more details refer to TN1290, [Memory Usage Guide for MachXO3 Devices](#).

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

Programmable I/O Cells (PIC)

The programmable logic associated with an I/O is called a PIO. The individual PIO are connected to their respective sysIO buffers and pads. On the MachXO3L/LF devices, the PIO cells are assembled into groups of four PIO cells called a Programmable I/O Cell or PIC. The PICs are placed on all four sides of the device.

On all the MachXO3L/LF devices, two adjacent PIOs can be combined to provide a complementary output driver pair.

All PIO pairs can implement differential receivers. Half of the PIO pairs on the top edge of these devices can be configured as true LVDS transmit pairs. The PIO pairs on the bottom edge of these devices have on-chip differential termination and also provide PCI support.

Input Gearbox

Each PIC on the bottom edge has a built-in 1:8 input gearbox. Each of these input gearboxes may be programmed as a 1:7 de-serializer or as one IDDRX4 (1:8) gearbox or as two IDDRX2 (1:4) gearboxes. Table 2-9 shows the gearbox signals.

Table 2-9. Input Gearbox Signal List

Name	I/O Type	Description
D	Input	High-speed data input after programmable delay in PIO A input register block
ALIGNWD	Input	Data alignment signal from device core
SCLK	Input	Slow-speed system clock
ECLK[1:0]	Input	High-speed edge clock
RST	Input	Reset
Q[7:0]	Output	Low-speed data to device core: Video RX(1:7): Q[6:0] GDDR4(1:8): Q[7:0] GDDR2(1:4)(IOL-A): Q4, Q5, Q6, Q7 GDDR2(1:4)(IOL-C): Q0, Q1, Q2, Q3

These gearboxes have three stage pipeline registers. The first stage registers sample the high-speed input data by the high-speed edge clock on its rising and falling edges. The second stage registers perform data alignment based on the control signals UPDATE and SEL0 from the control block. The third stage pipeline registers pass the data to the device core synchronized to the low-speed system clock. Figure 2-13 shows a block diagram of the input gearbox.

Table 2-11 shows the I/O standards (together with their supply and reference voltages) supported by the MachXO3L/LF devices. For further information on utilizing the sysIO buffer to support a variety of standards please see TN1280, [MachXO3 sysIO Usage Guide](#).

Table 2-11. Supported Input Standards

Input Standard	VCCIO (Typ.)				
	3.3 V	2.5 V	1.8 V	1.5 V	1.2 V
Single-Ended Interfaces					
LVTTTL	Yes				
LVC MOS33	Yes				
LVC MOS25		Yes			
LVC MOS18			Yes		
LVC MOS15				Yes	
LVC MOS12					Yes
PCI	Yes				
Differential Interfaces					
LVDS	Yes	Yes			
BLVDS, MLVDS, LVPECL, RSDS	Yes	Yes			
MIPI ¹	Yes	Yes			
LVTTLD	Yes				
LVC MOS33D	Yes				
LVC MOS25D		Yes			
LVC MOS18D			Yes		

1. These interfaces can be emulated with external resistors in all devices.

Table 2-12. Supported Output Standards

Output Standard	V _{CCIO} (Typ.)
Single-Ended Interfaces	
LVTTL	3.3
LVC MOS33	3.3
LVC MOS25	2.5
LVC MOS18	1.8
LVC MOS15	1.5
LVC MOS12	1.2
LVC MOS33, Open Drain	—
LVC MOS25, Open Drain	—
LVC MOS18, Open Drain	—
LVC MOS15, Open Drain	—
LVC MOS12, Open Drain	—

LVPECL ¹	3.3
MIPI ¹	2.5
LVTTL D	3.3
LVC MOS33D	3.3
LVC MOS25D	2.5
LVC MOS18D	1.8

1. These interfaces can be emulated with external resistors in all devices.

sysIO Buffer Banks

The numbers of banks vary between the devices of this family. MachXO3L/LF-1300 in the 256 Ball packages and the MachXO3L/LF-2100 and higher density devices have six I/O banks (one bank on the top, right and bottom side and three banks on the left side). The MachXO3L/LF-1300 and lower density devices have four banks (one bank per side). Figures 2-15 and 2-16 show the sysIO banks and their associated supplies for all devices.

Embedded Hardened IP Functions

All MachXO3L/LF devices provide embedded hardened functions such as SPI, I²C and Timer/Counter. MachXO3LF devices also provide User Flash Memory (UFM). These embedded blocks interface through the WISHBONE interface with routing as shown in Figure 2-17.

Figure 2-17. Embedded Function Block Interface

Hardened I²C IP Core

Every MachXO3L/LF device contains two I²C IP cores. These are the primary and secondary I²C IP cores. Either of the two cores can be configured either as an I²C master or as an I²C slave. The only difference between the two IP cores is that the primary core has pre-assigned I/O pins whereas users can assign I/O pins for the secondary core.

When the IP core is configured as a master it will be able to control other devices on the I²C bus through the interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I²C Master. The I²C cores support the following functionality:

- Master and Slave operation
- 7-bit and 10-bit addressing
- Multi-master arbitration support
- Up to 400 kHz data transfer speed
- General call support
- Interface to custom logic through 8-bit WISHBONE interface

Static Supply Current – C/E Devices^{1, 2, 3, 6}

t _{PRGMJ}	PROGRAMN low pulse rejection		—	25	ns
t _{INITL}	INITN low time	LCMXO3L/LF-640/ LCMXO3L/LF-1300	—	55	us
		LCMXO3L/LF-1300 256-Ball Package/ LCMXO3L/LF-2100	—	70	us
		LCMXO3L/LF-2100 324-Ball Package/ LCMXO3-4300	—	105	us
		LCMXO3L/LF-4300 400-Ball Package/ LCMXO3-6900	—	130	us
		LCMXO3L/LF-9400C	—	175	us
t _{DPPINIT}	PROGRAMN low to INITN low		—	150	ns
t _{DPPDONE}	PROGRAMN low to DONE low		—	150	ns
t _{IODISS}	PROGRAMN low to I/O disable		—	120	ns
Slave SPI					
f _{MAX}	CCLK clock frequency		—	66	MHz
t _{CCLKH}	CCLK clock pulse width high		7.5	—	ns
t _{CCLKL}	CCLK clock pulse width low		7.5	—	ns
t _{STSU}	CCLK setup time		2	—	ns
t _{STH}	CCLK hold time		0	—	ns
t _{STCO}	CCLK falling edge to valid output		—	10	ns
t _{STOZ}	CCLK falling edge to valid disable		—	10	ns
t _{STOV}	CCLK falling edge to valid enable		—	10	ns
t _{SCS}	Chip select high time		25	—	ns
t _{SCSS}	Chip select setup time		3	—	ns
t _{SCSH}	Chip select hold time		3	—	ns
Master SPI					
f _{MAX}	MCLK clock frequency		—	133	MHz
t _{MCLKH}	MCLK clock pulse width high		3.75	—	ns
t _{MCLKL}	MCLK clock pulse width low		3.75	—	ns
t _{STSU}	MCLK setup time		5	—	ns
t _{STH}	MCLK hold time		1	—	ns
t _{CSSPI}	INITN high to chip select low		100	200	ns
t _{MCLK}	INITN high to first MCLK edge		0.75	1	us

I²C Port Timing Specifications^{1, 2}

Symbol	Parameter	Min.	Max.	Units
f _{MAX}	Maximum SCL clock frequency	—	400	kHz

- MachXO3L/LF supports the following modes:
 - Standard-mode (Sm), with a bit rate up to 100 kbit/s (user and configuration mode)
 - Fast-mode (Fm), with a bit rate up to 400 kbit/s (user and configuration mode)
- Refer to the I²C specification for timing requirements.

SPI Port Timing Specifications¹

Symbol	Parameter	Min.	Max.	Units
f _{MAX}	Maximum SCK clock frequency	—	45	MHz

- Applies to user mode only. For configuration mode timing specifications, refer to sysCONFIG Port Timing Specifications table in this data sheet.

Switching Test Conditions

Figure 3-9 shows the output test load used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3-6.

Figure 3-9. Output Test Load, LVTTTL and LVCMOS Standards

Table 3-6. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R1	CL	Timing Ref.	VT
LVTTTL and LVCMOS settings (L -> H, H -> L)	∞	0pF	LVTTTL, LVCMOS 3.3 = 1.5 V	—
			LVCMOS 2.5 = V _{CCIO} /2	—
			LVCMOS 1.8 = V _{CCIO} /2	—
			LVCMOS 1.5 = V _{CCIO} /2	—
			LVCMOS 1.2 = V _{CCIO} /2	—
LVTTTL and LVCMOS 3.3 (Z -> H)	188	0pF	1.5	V _{OL}
LVTTTL and LVCMOS 3.3 (Z -> L)			1.5	V _{OH}
Other LVCMOS (Z -> H)			V _{CCIO} /2	V _{OL}
Other LVCMOS (Z -> L)			V _{CCIO} /2	V _{OH}
LVTTTL + LVCMOS (H -> Z)			V _{OH} - 0.15	V _{OL}
LVTTTL + LVCMOS (L -> Z)			V _{OL} - 0.15	V _{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

For Further Information

A variety of technical notes for the MachXO3 family are available on the Lattice web site.

MachXO3 Family Data Sheet

Revision History

February 2017

Advance Data Sheet DS1047

Date	Version	Section	Change Summary
February 2017	1.8	Architecture	Updated Supported Standards section. Corrected “MDVS” to “MLDVS” in Table 2-11, Supported Input Standards.
		DC and Switching Characteristics	Updated ESD Performance section. Added reference to the MachXO2 Product Family Qualification Summary document.
			Updated Static Supply Current – C/E Devices section. Added footnote 7.
			Updated MachXO3L/LF External Switching Characteristics – C/E Devices section. — Populated values for MachXO3L/LF-9400. — Under 7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1, corrected “t _{DVB} ” to “t _{DIB} ” and “t _{DVA} ” to “t _{DIA} ” and revised their descriptions. — Added Figure 3-6, Receiver GDDR71_RX Waveforms and Figure 3-7, Transmitter GDDR71_TX Waveforms.
		Pinout Information	Updated the Pin Information Summary section. Added MachXO3L/LF-9600C packages.
May 2016	1.7	DC and Switching Characteristics	Updated Absolute Maximum Ratings section. Modified I/O Tri-state Voltage Applied and Dedicated Input Voltage Applied footnotes.
			Updated sysIO Recommended Operating Conditions section. — Added standards. — Added V _{REF} (V) — Added footnote 4.
			Updated sysIO Single-Ended DC Electrical Characteristics section. Added I/O standards.
		Ordering Information	Updated MachXO3L Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added LCMXO3L-9400C part numbers.
			Updated MachXO3LF Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added LCMXO3L-9400C part numbers.

Date	Version	Section	Change Summary
June 2014	1.0	—	Product name/trademark adjustment.
		Introduction	Updated Features section.
			Updated Table 1-1, MachXO3L Family Selection Guide. Changed fcCSP packages to csfBGA. Adjusted 121-ball csfBGA arrow.
			Introduction section general update.
		Architecture	General update.
		DC and Switching Characteristics	Updated sysIO Recommended Operating Conditions section. Removed V_{REF} (V) column. Added standards.
			Updated Maximum sysIO Buffer Performance section. Added MIPI I/O standard.
			Updated MIPI D-PHY Emulation section. Changed Low Speed to Low Power. Updated Table 3-4, MIPI DC Conditions.
			Updated Table 3-5, MIPI D-PHY Output DC Conditions.
			Updated Maximum sysIO Buffer Performance section.
			Updated MachXO3L External Switching Characteristics – C/E Device section.
May 2014	00.3	Introduction	Updated Features section.
			Updated Table 1-1, MachXO3L Family Selection Guide. Moved 121-ball fcCSP arrow.
			General update of Introduction section.
		Architecture	General update.
		Pinout Information	Updated Pin Information Summary section. Updated or added data on WLCSP49, WLCSP81, CABGA324, and CABGA400 for specific devices.
		Ordering Information	Updated MachXO3L Part Number Description section. Updated or added data on WLCSP49, WLCSP81, CABGA324, and CABGA400 for specific devices.
			Updated Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added part numbers.
February 2014	00.2	DC and Switching Characteristics	Updated MachXO3L External Switching Characteristics – C/E Devices table. Removed LPDDR and DDR2 parameters.
	00.1	—	Initial release.
