

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	264
Number of Logic Elements/Cells	2112
Total RAM Bits	75776
Number of I/O	100
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	121-VFBGA, CSPBGA
Supplier Device Package	121-CSFBGA (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo3lf-2100e-6mg121c

Features

■ Solutions

- Smallest footprint, lowest power, high data throughput bridging solutions for mobile applications
- Optimized footprint, logic density, IO count, IO performance devices for IO management and logic applications
- High IO/logic, lowest cost/IO, high IO devices for IO expansion applications

■ Flexible Architecture

- Logic Density ranging from 640 to 9.4K LUT4
- High IO to LUT ratio with up to 384 IO pins

■ Advanced Packaging

- 0.4 mm pitch: 1K to 4K densities in very small footprint WLCSP (2.5 mm x 2.5 mm to 3.8 mm x 3.8 mm) with 28 to 63 IOs
- 0.5 mm pitch: 640 to 6.9K LUT densities in 6 mm x 6 mm to 10 mm x 10 mm BGA packages with up to 281 IOs
- 0.8 mm pitch: 1K to 9.4K densities with up to 384 IOs in BGA packages

■ Pre-Engineered Source Synchronous I/O

- DDR registers in I/O cells
- Dedicated gearing logic
- 7:1 Gearing for Display I/Os
- Generic DDR, DDRx2, DDRx4

■ High Performance, Flexible I/O Buffer

- Programmable sysIO™ buffer supports wide range of interfaces:
 - LVCMOS 3.3/2.5/1.8/1.5/1.2
 - LVTTTL
 - LVDS, Bus-LVDS, MLVDS, LVPECL
 - MIPI D-PHY Emulated
 - Schmitt trigger inputs, up to 0.5 V hysteresis
- Ideal for IO bridging applications
- I/Os support hot socketing
- On-chip differential termination
- Programmable pull-up or pull-down mode

■ Flexible On-Chip Clocking

- Eight primary clocks
- Up to two edge clocks for high-speed I/O interfaces (top and bottom sides only)
- Up to two analog PLLs per device with fractional-n frequency synthesis
 - Wide input frequency range (7 MHz to 400 MHz)

■ Non-volatile, Multi-time Programmable

- Instant-on
 - Powers up in microseconds
- Optional dual boot with external SPI memory
- Single-chip, secure solution
- Programmable through JTAG, SPI or I²C
- MachXO3L includes multi-time programmable NVCM
- MachXO3LF infinitely reconfigurable Flash
 - Supports background programming of non-volatile memory

■ TransFR Reconfiguration

- In-field logic update while IO holds the system state

■ Enhanced System Level Support

- On-chip hardened functions: SPI, I²C, timer/counter
- On-chip oscillator with 5.5% accuracy
- Unique TraceID for system tracking
- Single power supply with extended operating range
- IEEE Standard 1149.1 boundary scan
- IEEE 1532 compliant in-system programming

■ Applications

- Consumer Electronics
- Compute and Storage
- Wireless Communications
- Industrial Control Systems
- Automotive System

■ Low Cost Migration Path

- Migration from the Flash based MachXO3LF to the NVCM based MachXO3L
- Pin compatible and equivalent timing

Architecture Overview

The MachXO3L/LF family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). All logic density devices in this family have sysCLOCK™ PLLs and blocks of sysMEM Embedded Block RAM (EBRs). Figure 2-1 and Figure 2-2 show the block diagrams of the various family members.

Figure 2-1. Top View of the MachXO3L/LF-1300 Device

Notes:

- MachXO3L/LF-640 is similar to MachXO3L/LF-1300. MachXO3L/LF-640 has a lower LUT count.
- MachXO3L devices have NVCM, MachXO3LF devices have Flash.

Figure 2-2. Top View of the MachXO3L/LF-4300 Device

Notes:

- MachXO3L/LF-1300, MachXO3L/LF-2100, MachXO3L/LF-6900 and MachXO3L/LF-9400 are similar to MachXO3L/LF-4300. MachXO3L/LF-1300 has a lower LUT count, one PLL, and seven EBR blocks. MachXO3L/LF-2100 has a lower LUT count, one PLL, and eight EBR blocks. MachXO3L/LF-6900 has a higher LUT count, two PLLs, and 26 EBR blocks. MachXO3L/LF-9400 has a higher LUT count, two PLLs, and 48 EBR blocks.
- MachXO3L devices have NVCM, MachXO3LF devices have Flash.

The logic blocks, Programmable Functional Unit (PFU) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each row has either the logic blocks or the EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the MachXO3L/LF family, the number of sysIO banks varies by device. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag “hard” control logic to minimize LUT usage.

The MachXO3L/LF registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

The MachXO3L/LF architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks. These blocks are located at the ends of the on-chip NVCM/Flash block. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

MachXO3L/LF devices provide commonly used hardened functions such as SPI controller, I²C controller and timer/counter.

MachXO3LF devices also provide User Flash Memory (UFM). These hardened functions and the UFM interface to the core logic and routing through a WISHBONE interface. The UFM can also be accessed through the SPI, I²C and JTAG ports.

Every device in the family has a JTAG port that supports programming and configuration of the device as well as access to the user logic. The MachXO3L/LF devices are available for operation from 3.3 V, 2.5 V and 1.2 V power supplies, providing easy integration into the overall system.

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode

In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode

Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Up/down counter with asynchronous clear
- Up/down counter with preload (sync)
- Ripple mode multiplier building block
- Multiplier support
- Comparator functions of A and B inputs
 - A greater-than-or-equal-to B
 - A not-equal-to B
 - A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO3L/LF devices support distributed memory initialization.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO3L/LF devices, please see TN1290, [Memory Usage Guide for MachXO3 Devices](#).

Table 2-3. Number of Slices Required For Implementing Distributed RAM

	SPR 16x4	PDPR 16x4
Number of slices	3	3

Note: SPR = Single Port RAM, PDPR = Pseudo Dual Port RAM

ROM Mode

ROM mode uses the LUT logic; hence, slices 0-3 can be used in ROM mode. Preloading is accomplished through the programming interface during PFU configuration.

For more information on the RAM and ROM modes, please refer to TN1290, [Memory Usage Guide for MachXO3 Devices](#).

Routing

There are many resources provided in the MachXO3L/LF devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with three different types of routing resources: x1 (spans two PFUs), x2 (spans three PFUs) and x6 (spans seven PFUs). The x1, x2, and x6 connections provide fast and efficient connections in the horizontal and vertical directions.

The design tools take the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

Clock/Control Distribution Network

Each MachXO3L/LF device has eight clock inputs (PCLK [T, C] [Banknum]_[2..0]) – three pins on the left side, two pins each on the bottom and top sides and one pin on the right side. These clock inputs drive the clock nets. These eight inputs can be differential or single-ended and may be used as general purpose I/O if they are not used to drive the clock nets. When using a single ended clock input, only the PCLKT input can drive the clock tree directly.

The MachXO3L/LF architecture has three types of clocking resources: edge clocks, primary clocks and secondary high fanout nets. MachXO3L/LF devices have two edge clocks each on the top and bottom edges. Edge clocks are used to clock I/O registers and have low injection time and skew. Edge clock inputs are from PLL outputs, primary clock pads, edge clock bridge outputs and CIB sources.

The eight primary clock lines in the primary clock network drive throughout the entire device and can provide clocks for all resources within the device including PFUs, EBRs and PICs. In addition to the primary clock signals, MachXO3L/LF devices also have eight secondary high fanout signals which can be used for global control signals, such as clock enables, synchronous or asynchronous clears, presets, output enables, etc. Internal logic can drive the global clock network for internally-generated global clocks and control signals.

The maximum frequency for the primary clock network is shown in the MachXO3L/LF External Switching Characteristics table.

Primary clock signals for the MachXO3L/LF-1300 and larger devices are generated from eight 27:1 muxes. The available clock sources include eight I/O sources, 11 routing inputs, eight clock divider inputs and up to eight sys-CLOCK PLL outputs.

Table 2-6. EBR Signal Descriptions

Port Name	Description	Active State
CLK	Clock	Rising Clock Edge
CE	Clock Enable	Active High
OCE ¹	Output Clock Enable	Active High
RST	Reset	Active High
BE ¹	Byte Enable	Active High
WE	Write Enable	Active High
AD	Address Bus	—
DI	Data In	—
DO	Data Out	—
CS	Chip Select	Active High
AFF	FIFO RAM Almost Full Flag	—
FF	FIFO RAM Full Flag	—
AEF	FIFO RAM Almost Empty Flag	—
EF	FIFO RAM Empty Flag	—
RPRST	FIFO RAM Read Pointer Reset	—

1. Optional signals.
2. For dual port EBR primitives a trailing 'A' or 'B' in the signal name specifies the EBR port A or port B respectively.
3. For FIFO RAM mode primitive, a trailing 'R' or 'W' in the signal name specifies the FIFO read port or write port respectively.
4. For FIFO RAM mode primitive FULLI has the same function as CSW(2) and EMPTYI has the same function as CSR(2).
5. In FIFO mode, CLKW is the write port clock, CSW is the write port chip select, CLKR is the read port clock, CSR is the read port chip select, ORE is the output read enable.

The EBR memory supports three forms of write behavior for single or dual port operation:

1. **Normal** – Data on the output appears only during the read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
2. **Write Through** – A copy of the input data appears at the output of the same port. This mode is supported for all data widths.
3. **Read-Before-Write** – When new data is being written, the old contents of the address appears at the output.

FIFO Configuration

The FIFO has a write port with data-in, CEW, WE and CLKW signals. There is a separate read port with data-out, RCE, RE and CLKR signals. The FIFO internally generates Almost Full, Full, Almost Empty and Empty Flags. The Full and Almost Full flags are registered with CLKW. The Empty and Almost Empty flags are registered with CLKR. Table 2-7 shows the range of programming values for these flags.

Table 2-7. Programmable FIFO Flag Ranges

Flag Name	Programming Range
Full (FF)	1 to max (up to 2^N-1)
Almost Full (AF)	1 to Full-1
Almost Empty (AE)	1 to Full-1
Empty (EF)	0

N = Address bit width.

The FIFO state machine supports two types of reset signals: RST and RPRST. The RST signal is a global reset that clears the contents of the FIFO by resetting the read/write pointer and puts the FIFO flags in their initial reset

state. The RPRST signal is used to reset the read pointer. The purpose of this reset is to retransmit the data that is in the FIFO. In these applications it is important to keep careful track of when a packet is written into or read from the FIFO.

Memory Core Reset

The memory core contains data output latches for ports A and B. These are simple latches that can be reset synchronously or asynchronously. RSTA and RSTB are local signals, which reset the output latches associated with port A and port B respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-9.

Figure 2-9. Memory Core Reset

For further information on the sysMEM EBR block, please refer to TN1290, [Memory Usage Guide for MachXO3 Devices](#).

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-10. The GSR input to the EBR is always asynchronous.

Figure 2-10. EBR Asynchronous Reset (Including GSR) Timing Diagram

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/t_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

Table 2-11 shows the I/O standards (together with their supply and reference voltages) supported by the MachXO3L/LF devices. For further information on utilizing the sysIO buffer to support a variety of standards please see TN1280, [MachXO3 sysIO Usage Guide](#).

Table 2-11. Supported Input Standards

Input Standard	VCCIO (Typ.)				
	3.3 V	2.5 V	1.8 V	1.5 V	1.2 V
Single-Ended Interfaces					
LVTTTL	Yes				
LVC MOS33	Yes				
LVC MOS25		Yes			
LVC MOS18			Yes		
LVC MOS15				Yes	
LVC MOS12					Yes
PCI	Yes				
Differential Interfaces					
LVDS	Yes	Yes			
BLVDS, MLVDS, LVPECL, RSDS	Yes	Yes			
MIPI ¹	Yes	Yes			
LVTTLD	Yes				
LVC MOS33D	Yes				
LVC MOS25D		Yes			
LVC MOS18D			Yes		

1. These interfaces can be emulated with external resistors in all devices.

Figure 2-18. I²C Core Block Diagram

Table 2-14 describes the signals interfacing with the I²C cores.

Table 2-14. I²C Core Signal Description

Signal Name	I/O	Description
i2c_scl	Bi-directional	Bi-directional clock line of the I ² C core. The signal is an output if the I ² C core is in master mode. The signal is an input if the I ² C core is in slave mode. MUST be routed directly to the pre-assigned I/O of the chip. Refer to the Pinout Information section of this document for detailed pad and pin locations of I ² C ports in each MachXO3L/LF device.
i2c_sda	Bi-directional	Bi-directional data line of the I ² C core. The signal is an output when data is transmitted from the I ² C core. The signal is an input when data is received into the I ² C core. MUST be routed directly to the pre-assigned I/O of the chip. Refer to the Pinout Information section of this document for detailed pad and pin locations of I ² C ports in each MachXO3L/LF device.
i2c_irqo	Output	Interrupt request output signal of the I ² C core. The intended usage of this signal is for it to be connected to the WISHBONE master controller (i.e. a microcontroller or state machine) and request an interrupt when a specific condition is met. These conditions are described with the I ² C register definitions.
cfg_wake	Output	Wake-up signal – To be connected only to the power module of the MachXO3L/LF device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, I ² C Tab.
cfg_stdbby	Output	Stand-by signal – To be connected only to the power module of the MachXO3L/LF device. The signal is enabled only if the “Wakeup Enable” feature has been set within the EFB GUI, I ² C Tab.

Hardened SPI IP Core

Every MachXO3L/LF device has a hard SPI IP core that can be configured as a SPI master or slave. When the IP core is configured as a master it will be able to control other SPI enabled chips connected to the SPI bus. When the core is configured as the slave, the device will be able to interface to an external SPI master. The SPI IP core on MachXO3L/LF devices supports the following functions:

- Configurable Master and Slave modes
- Full-Duplex data transfer
- Mode fault error flag with CPU interrupt capability
- Double-buffered data register
- Serial clock with programmable polarity and phase
- LSB First or MSB First Data Transfer
- Interface to custom logic through 8-bit WISHBONE interface

Security and One-Time Programmable Mode (OTP)

For applications where security is important, the lack of an external bitstream provides a solution that is inherently more secure than SRAM-based FPGAs. This is further enhanced by device locking. MachXO3L/LF devices contain security bits that, when set, prevent the readback of the SRAM configuration and NVCM/Flash spaces. The device can be in one of two modes:

1. Unlocked – Readback of the SRAM configuration and NVCM/Flash spaces is allowed.
2. Permanently Locked – The device is permanently locked.

Once set, the only way to clear the security bits is to erase the device. To further complement the security of the device, a One Time Programmable (OTP) mode is available. Once the device is set in this mode it is not possible to erase or re-program the NVCM/Flash and SRAM OTP portions of the device. For more details, refer to TN1279, [MachXO3 Programming and Configuration Usage Guide](#).

Password

The MachXO3LF supports a password-based security access feature also known as Flash Protect Key. Optionally, the MachXO3L device can be ordered with a custom specification (c-spec) to support this feature. The Flash Protect Key feature provides a method of controlling access to the Configuration and Programming modes of the device. When enabled, the Configuration and Programming edit mode operations (including Write, Verify and Erase operations) are allowed only when coupled with a Flash Protect Key which matches that expected by the device. Without a valid Flash Protect Key, the user can perform only rudimentary non-configuration operations such as Read Device ID. For more details, refer to TN1313, [Using Password Security with MachXO3 Devices](#).

Dual Boot

MachXO3L/LF devices can optionally boot from two patterns, a primary bitstream and a golden bitstream. If the primary bitstream is found to be corrupt while being downloaded into the SRAM, the device shall then automatically re-boot from the golden bitstream. Note that the primary bitstream must reside in the external SPI Flash. The golden image MUST reside in an on-chip NVCM/Flash. For more details, refer to TN1279, [MachXO3 Programming and Configuration Usage Guide](#).

Soft Error Detection

The SED feature is a CRC check of the SRAM cells after the device is configured. This check ensures that the SRAM cells were configured successfully. This feature is enabled by a configuration bit option. The Soft Error Detection can also be initiated in user mode via an input to the fabric. The clock for the Soft Error Detection circuit is generated using a dedicated divider. The undivided clock from the on-chip oscillator is the input to this divider. For low power applications users can switch off the Soft Error Detection circuit. For more details, refer to TN1292, [MachXO3 Soft Error Detection Usage Guide](#).

Soft Error Correction

The MachXO3LF device supports Soft Error Correction (SEC). Optionally, the MachXO3L device can be ordered with a custom specification (c-spec) to support this feature. When BACKGROUND_RECONFIG is enabled using the Lattice Diamond Software in a design, asserting the PROGRAMN pin or issuing the REFRESH sysConfig command refreshes the SRAM array from configuration memory. Only the detected error bit is corrected. No other SRAM cells are changed, allowing the user design to function uninterrupted.

During the project design phase, if the overall system cannot guarantee containment of the error or its subsequent effects on downstream data or control paths, Lattice recommends using SED only. The MachXO3 can be then be soft-reset by asserting PROGRAMN or issuing the Refresh command over a sysConfig port in response to SED. Soft-reset additionally erases the SRAM array prior to the SRAM refresh, and asserts internal Reset circuitry to guarantee a known state. For more details, refer to TN1292, [MachXO3 Soft Error Detection \(SED\)/Correction \(SEC\) Usage Guide](#).

Static Supply Current – C/E Devices^{1, 2, 3, 6}

Symbol	Parameter	Device	Typ. ⁴	Units
I _{CC}	Core Power Supply	LCMXO3L/LF-1300C 256 Ball Package	4.8	mA
		LCMXO3L/LF-2100C	4.8	mA

		LCMXO3L/LF-9400E	5.66	mA
I _{CCIO}	Bank Power Supply ⁵ V _{CCIO} = 2.5 V	All devices	0	mA

1. For further information on supply current, please refer to TN1289, [Power Estimation and Management for MachXO3 Devices](#).

2. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip oscillator is off, on-chip PLL is off.

3. Frequency = 0 MHz.

4. T_J = 25 °C, power supplies at nominal voltage.

5. Does not include pull-up/pull-down.

6. To determine the MachXO3L/LF peak start-up current data, use the Power Calculator tool.

7. Determination of safe ambient operating conditions requires use of the Diamond Power Calculator tool.

Typical Building Block Function Performance – C/E Devices¹

Pin-to-Pin Performance (LVCMOS25 12 mA Drive)

Function	–6 Timing	Units
Basic Functions		
16-bit decoder	8.9	ns
4:1 MUX	7.5	ns
16:1 MUX	8.3	ns

Register-to-Register Performance

Function	–6 Timing	Units
Basic Functions		
16:1 MUX	412	MHz
16-bit adder	297	MHz
16-bit counter	324	MHz
64-bit counter	161	MHz
Embedded Memory Functions		
1024x9 True-Dual Port RAM (Write Through or Normal, EBR output registers)	183	MHz
Distributed Memory Functions		
16x4 Pseudo-Dual Port RAM (one PFU)	500	MHz

1. The above timing numbers are generated using the Diamond design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device. Commercial timing numbers are shown at 85 °C and 1.14 V. Other operating conditions, including industrial, can be extracted from the Diamond software.

Derating Logic Timing

Logic timing provided in the following sections of the data sheet and the Lattice design tools are worst case numbers in the operating range. Actual delays may be much faster. Lattice design tools can provide logic timing numbers at a particular temperature and voltage.

MachXO3 Family Data Sheet

Revision History

February 2017

Advance Data Sheet DS1047

Date	Version	Section	Change Summary
February 2017	1.8	Architecture	Updated Supported Standards section. Corrected “MDVS” to “MLDVS” in Table 2-11, Supported Input Standards.
		DC and Switching Characteristics	Updated ESD Performance section. Added reference to the MachXO2 Product Family Qualification Summary document.
			Updated Static Supply Current – C/E Devices section. Added footnote 7.
			Updated MachXO3L/LF External Switching Characteristics – C/E Devices section. — Populated values for MachXO3L/LF-9400. — Under 7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1, corrected “t _{DVB} ” to “t _{DIB} ” and “t _{DVA} ” to “t _{DIA} ” and revised their descriptions. — Added Figure 3-6, Receiver GDDR71_RX Waveforms and Figure 3-7, Transmitter GDDR71_TX Waveforms.
		Pinout Information	Updated the Pin Information Summary section. Added MachXO3L/LF-9600C packages.
May 2016	1.7	DC and Switching Characteristics	Updated Absolute Maximum Ratings section. Modified I/O Tri-state Voltage Applied and Dedicated Input Voltage Applied footnotes.
			Updated sysIO Recommended Operating Conditions section. — Added standards. — Added V _{REF} (V) — Added footnote 4.
			Updated sysIO Single-Ended DC Electrical Characteristics section. Added I/O standards.
		Ordering Information	Updated MachXO3L Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added LCMXO3L-9400C part numbers.
			Updated MachXO3LF Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added LCMXO3L-9400C part numbers.
