Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

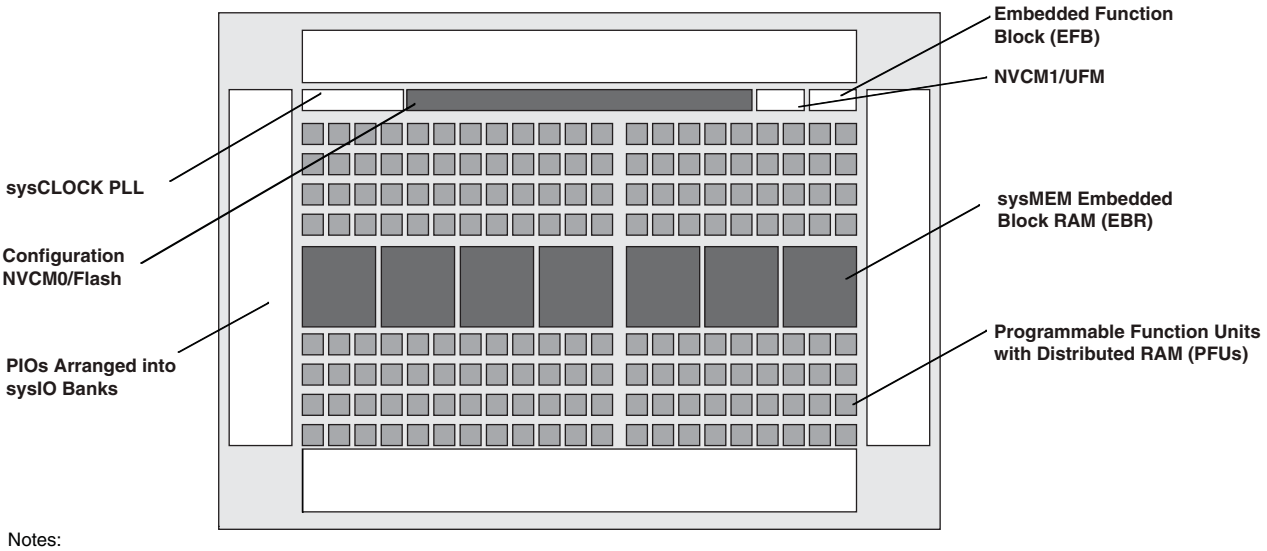
The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	540
Number of Logic Elements/Cells	4320
Total RAM Bits	94208
Number of I/O	206
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LFBGA
Supplier Device Package	256-CABGA (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo3lf-4300c-6bg256c

Architecture Overview

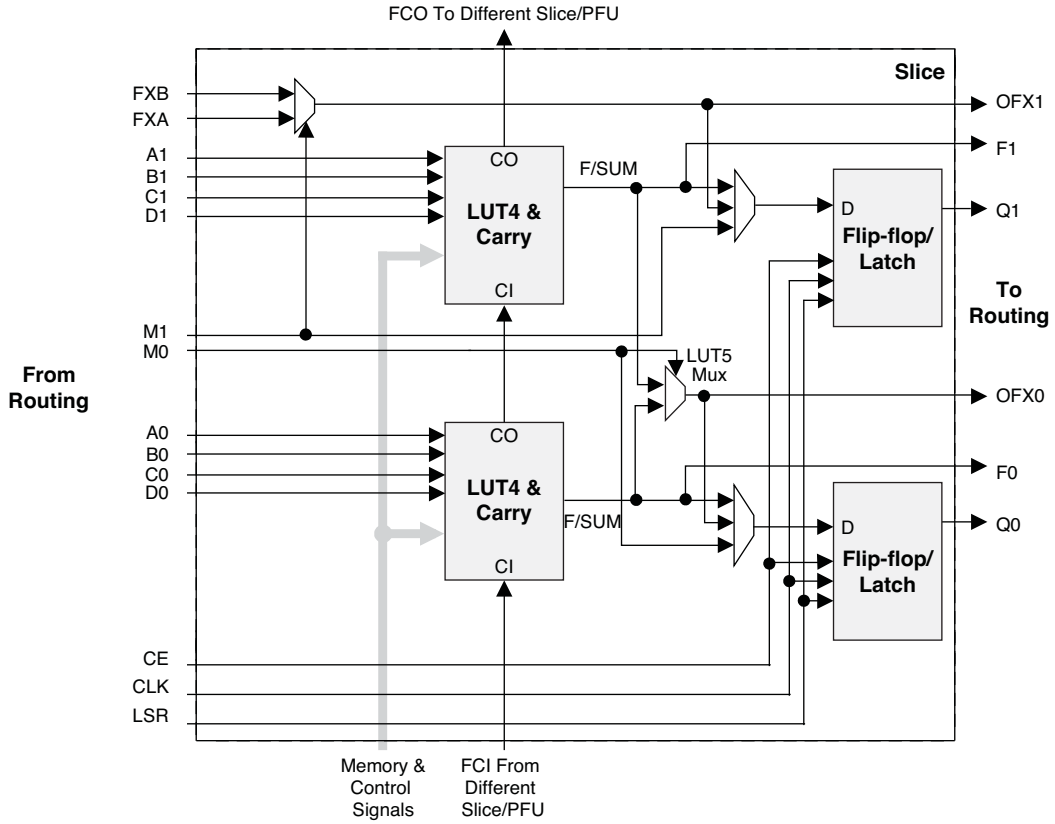
The MachXO3L/LF family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). All logic density devices in this family have sysCLOCK™ PLLs and blocks of sysMEM Embedded Block RAM (EBRs). Figure 2-1 and Figure 2-2 show the block diagrams of the various family members.

Figure 2-1. Top View of the MachXO3L/LF-1300 Device



Notes:
- MachXO3L/LF-640 is similar to MachXO3L/LF-1300. MachXO3L/LF-640 has a lower LUT count.
- MachXO3L devices have NVCM, MachXO3LF devices have Flash.

Figure 2-4. Slice Diagram



For Slices 0 and 1, memory control signals are generated from Slice 2 as follows:

- WCK is CLK
- WRE is from LSR
- DI[3:2] for Slice 1 and DI[1:0] for Slice 0 data from Slice 2
- WAD [A:D] is a 4-bit address from slice 2 LUT input

Table 2-2. Slice Signal Descriptions

Function	Type	Signal Names	Description
Input	Data signal	A0, B0, C0, D0	Inputs to LUT4
Input	Data signal	A1, B1, C1, D1	Inputs to LUT4
Input	Multi-purpose	M0/M1	Multi-purpose input
Input	Control signal	CE	Clock enable
Input	Control signal	LSR	Local set/reset
Input	Control signal	CLK	System clock
Input	Inter-PFU signal	FCIN	Fast carry in[1]
Output	Data signals	F0, F1	LUT4 output register bypass signals
Output	Data signals	Q0, Q1	Register outputs
Output	Data signals	OFX0	Output of a LUT5 MUX
Output	Data signals	OFX1	Output of a LUT6, LUT7, LUT8[2] MUX depending on the slice
Output	Inter-PFU signal	FCO	Fast carry out[1]

1. See Figure 2-3 for connection details.
2. Requires two PFUs.

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode
In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode
Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Up/down counter with asynchronous clear
- Up/down counter with preload (sync)
- Ripple mode multiplier building block
- Multiplier support
- Comparator functions of A and B inputs
  — A greater-than-or-equal-to B
  — A not-equal-to B
  — A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO3L/LF devices support distributed memory initialization.

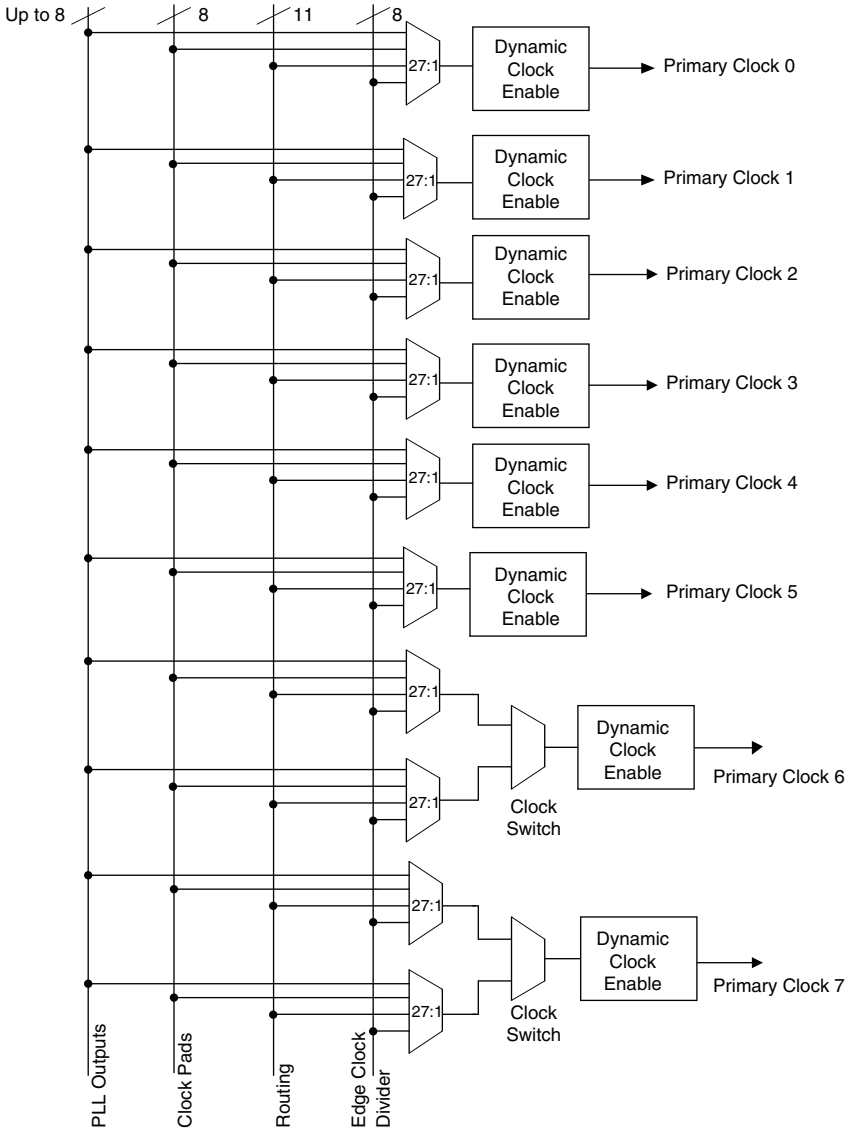
The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO3L/LF devices, please see TN1290, Memory Usage Guide for MachXO3 Devices.

Table 2-3. Number of Slices Required For Implementing Distributed RAM

	SPR 16x4	PDPR 16x4
Number of slices	3	3

Note: SPR = Single Port RAM, PDPR = Pseudo Dual Port RAM

Figure 2-5. Primary Clocks for MachXO3L/LF Devices



Eight secondary high fanout nets are generated from eight 8:1 muxes as shown in Figure 2-6. One of the eight inputs to the secondary high fanout net input mux comes from dual function clock pins and the remaining seven come from internal routing. The maximum frequency for the secondary clock network is shown in MachXO3L/LF External Switching Characteristics table.

Table 2-5. sysMEM Block Configurations

Memory Mode	Configurations
Single Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9
True Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9
Pseudo Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18
FIFO	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18

Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1, and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. EBR initialization data can be loaded from the NVCM or Configuration Flash.

MachXO3LF EBR initialization data can also be loaded from the UFM. To maximize the number of UFM bits, initialize the EBRs used in your design to an all-zero pattern. Initializing to an all-zero pattern does not use up UFM bits. MachXO3LF devices have been designed such that multiple EBRs share the same initialization memory space if they are initialized to the same pattern.

By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Memory Cascading

Larger and deeper blocks of RAM can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual, Pseudo-Dual Port and FIFO Modes

Figure 2-8 shows the five basic memory configurations and their input/output names. In all the sysMEM RAM modes, the input data and addresses for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the memory array output.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in groups referred to as banks. The sysIO buffers allow users to implement a wide variety of standards that are found in today's systems including LVCMOS, TTL, PCI, LVDS, BLVDS, MLVDS and LVPECL.

Each bank is capable of supporting multiple I/O standards. In the MachXO3L/LF devices, single-ended output buffers, ratioed input buffers (LVTTL, LVCMOS and PCI), differential (LVDS) input buffers are powered using I/O supply voltage (V_{CCIO}). Each sysIO bank has its own V_{CCIO}.

MachXO3L/LF devices contain three types of sysIO buffer pairs.

1. **Left and Right sysIO Buffer Pairs**
   The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the left and right of the devices also have differential input buffers.

2. **Bottom sysIO Buffer Pairs**
   The sysIO buffer pairs in the bottom bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the bottom also have differential input buffers. Only the I/Os on the bottom banks have programmable PCI clamps and differential input termination. The PCI clamp is enabled after V_{CC} and V_{CCIO} are at valid operating levels and the device has been configured.

3. **Top sysIO Buffer Pairs**
   The sysIO buffer pairs in the top bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the top also have differential I/O buffers. Half of the sysIO buffer pairs on the top edge have true differential outputs. The sysIO buffer pair comprising of the A and B PIOs in every PIC on the top edge have a differential output driver.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCIO0} have reached V_{PORUP} level defined in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-down to GND (some pins such as PROGRAMN and the JTAG pins have weak pull-up to V_{CCIO} as the default functionality). The I/O pins will maintain the blank configuration until V_{CC} and V_{CCIO} (for I/O banks containing configuration I/Os) have reached V_{PORUP} levels at which time the I/Os will take on the user-configured settings only after a proper download/configuration.

There are various ways a user can ensure that there are no spurious signals on critical outputs as the device powers up. These are discussed in more detail in TN1280, MachXO3 sysIO Usage Guide.

Supported Standards

The MachXO3L/LF sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS, LVTTL, and PCI. The buffer supports the LVTTL, PCI, LVCMOS 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS, MLVDS and LVPECL output emulation is supported on all devices. The MachXO3L/LF devices support on-chip LVDS output buffers on approximately 50% of the I/Os on the top bank. Differential receivers for LVDS, BLVDS, MLVDS and LVPECL are supported on all banks of MachXO3L/LF devices. PCI support is provided in the bottom bank of the MachXO3L/LF devices. Table 2-11 summarizes the I/O characteristics of the MachXO3L/LF PLDs.

Hot Socketing

The MachXO3L/LF devices have been carefully designed to ensure predictable behavior during power-up and power-down. Leakage into I/O pins is controlled to within specified limits. This allows for easy integration with the rest of the system. These capabilities make the MachXO3L/LF ideal for many multiple power supply and hot-swap applications.

On-chip Oscillator

Every MachXO3L/LF device has an internal CMOS oscillator. The oscillator output can be routed as a clock to the clock tree or as a reference clock to the sysCLOCK PLL using general routing resources. The oscillator frequency can be divided by internal logic. There is a dedicated programming bit and a user input to enable/disable the oscillator. The oscillator frequency ranges from 2.08 MHz to 133 MHz. The software default value of the Master Clock (MCLK) is nominally 2.08 MHz. When a different MCLK is selected during the design process, the following sequence takes place:

1. Device powers up with a nominal MCLK frequency of 2.08 MHz.
2. During configuration, users select a different master clock frequency.
3. The MCLK frequency changes to the selected frequency once the clock configuration bits are received.
4. If the user does not select a master clock frequency, then the configuration bitstream defaults to the MCLK frequency of 2.08 MHz.

Table 2-13 lists all the available MCLK frequencies.

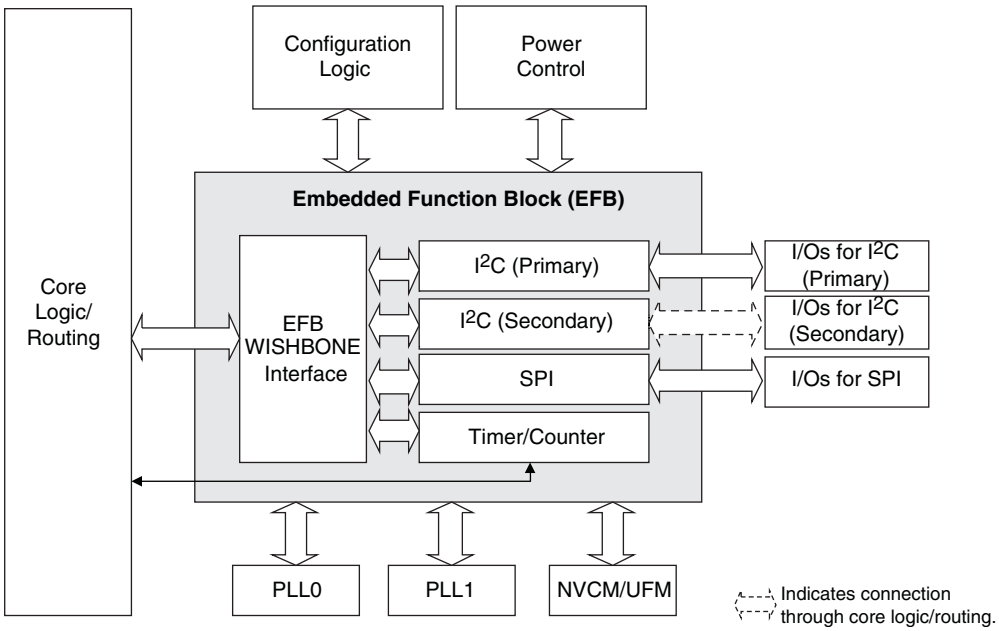
Table 2-13. Available MCLK Frequencies

MCLK (MHz, Nominal)	MCLK (MHz, Nominal)	MCLK (MHz, Nominal)
2.08 (default)	9.17	33.25
2.46	10.23	38
3.17	13.3	44.33
4.29	14.78	53.2
5.54	20.46	66.5
7	26.6	88.67
8.31	29.56	133

Embedded Hardened IP Functions

All MachXO3L/LF devices provide embedded hardened functions such as SPI, I²C and Timer/Counter. MachXO3LF devices also provide User Flash Memory (UFM). These embedded blocks interface through the WISHBONE interface with routing as shown in Figure 2-17.

Figure 2-17. Embedded Function Block Interface



Hardened I²C IP Core

Every MachXO3L/LF device contains two I²C IP cores. These are the primary and secondary I²C IP cores. Either of the two cores can be configured either as an I²C master or as an I²C slave. The only difference between the two IP cores is that the primary core has pre-assigned I/O pins whereas users can assign I/O pins for the secondary core.

When the IP core is configured as a master it will be able to control other devices on the I²C bus through the interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I²C Master. The I²C cores support the following functionality:

- Master and Slave operation
- 7-bit and 10-bit addressing
- Multi-master arbitration support
- Up to 400 kHz data transfer speed
- General call support
- Interface to custom logic through 8-bit WISHBONE interface

Hardened Timer/Counter

MachXO3L/LF devices provide a hard Timer/Counter IP core. This Timer/Counter is a general purpose, bi-directional, 16-bit timer/counter module with independent output compare units and PWM support. The Timer/Counter supports the following functions:

- Supports the following modes of operation:
  — Watchdog timer
  — Clear timer on compare match
  — Fast PWM
  — Phase and Frequency Correct PWM
- Programmable clock input source
- Programmable input clock prescaler
- One static interrupt output to routing
- One wake-up interrupt to on-chip standby mode controller.
- Three independent interrupt sources: overflow, output compare match, and input capture
- Auto reload
- Time-stamping support on the input capture unit
- Waveform generation on the output
- Glitch-free PWM waveform generation with variable PWM period
- Internal WISHBONE bus access to the control and status registers
- Stand-alone mode with preloaded control registers and direct reset input

Figure 2-20. Timer/Counter Block Diagram

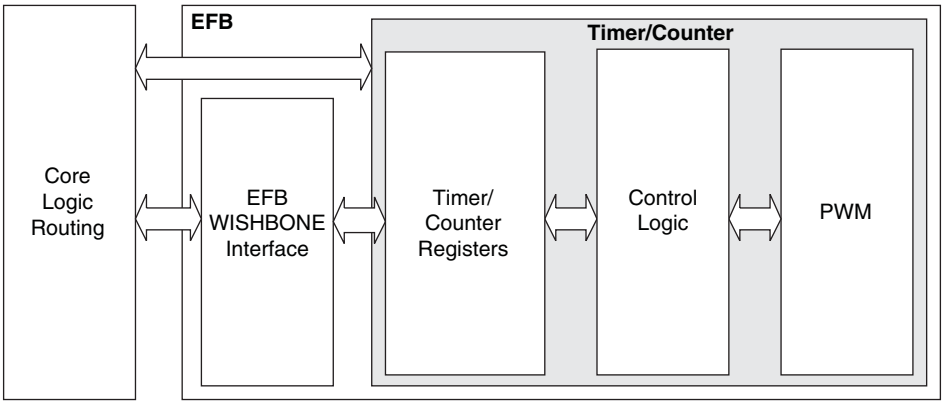


Table 2-16. Timer/Counter Signal Description

Port	I/O	Description
tc_clki	I	Timer/Counter input clock signal
tc_rstn	I	Register tc_rstn_ena is preloaded by configuration to always keep this pin enabled
tc_ic	I	Input capture trigger event, applicable for non-pwm modes with WISHBONE interface. If enabled, a rising edge of this signal will be detected and synchronized to capture tc_cnt value into tc_icr for time-stamping.
tc_int	O	Without WISHBONE – Can be used as overflow flag With WISHBONE – Controlled by three IRQ registers
tc_oc	O	Timer counter output signal

Configuration and Testing

This section describes the configuration and testing features of the MachXO3L/LF family.

IEEE 1149.1-Compliant Boundary Scan Testability

All MachXO3L/LF devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port shares its power supply with V_{CCIO} Bank 0 and can operate with LVCMOS3.3, 2.5, 1.8, 1.5, and 1.2 standards.

For more details on boundary scan test, see AN8066, Boundary Scan Testability with Lattice sysIO Capability and TN1087, Minimizing System Interruption During Configuration Using TransFR Technology.

Device Configuration

All MachXO3L/LF devices contain two ports that can be used for device configuration. The Test Access Port (TAP), which supports bit-wide configuration and the sysCONFIG port which supports serial configuration through I^2C or SPI. The TAP supports both the IEEE Standard 1149.1 Boundary Scan specification and the IEEE Standard 1532 In-System Configuration specification. There are various ways to configure a MachXO3L/LF device:

1. Internal NVCM/Flash Download
2. JTAG
3. Standard Serial Peripheral Interface (Master SPI mode) – interface to boot PROM memory
4. System microprocessor to drive a serial slave SPI port (SSPI mode)
5. Standard I^2C Interface to system microprocessor

Upon power-up, the configuration SRAM is ready to be configured using the selected sysCONFIG port. Once a configuration port is selected, it will remain active throughout that configuration cycle. The IEEE 1149.1 port can be activated any time after power-up by sending the appropriate command through the TAP port. Optionally the device can run a CRC check upon entering the user mode. This will ensure that the device was configured correctly.

The sysCONFIG port has 10 dual-function pins which can be used as general purpose I/Os if they are not required for configuration. See TN1279, MachXO3 Programming and Configuration Usage Guide for more information about using the dual-use pins as general purpose I/Os.

Lattice design software uses proprietary compression technology to compress bit-streams for use in MachXO3L/LF devices. Use of this technology allows Lattice to provide a lower cost solution. In the unlikely event that this technology is unable to compress bitstreams to fit into the amount of on-chip NVCM/Flash, there are a variety of techniques that can be utilized to allow the bitstream to fit in the on-chip NVCM/Flash. For more details, refer to TN1279, MachXO3 Programming and Configuration Usage Guide.

The Test Access Port (TAP) has five dual purpose pins (TDI, TDO, TMS, TCK and JTAGENB). These pins are dual function pins - TDI, TDO, TMS and TCK can be used as general purpose I/O if desired. For more details, refer to TN1279, MachXO3 Programming and Configuration Usage Guide.

TransFR (Transparent Field Reconfiguration)
TransFR is a unique Lattice technology that allows users to update their logic in the field without interrupting system operation using a simple push-button solution. For more details refer to TN1087, Minimizing System Interruption During Configuration Using TransFR Technology for details.

DC Electrical Characteristics

Over Recommended Operating Conditions

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
I_{IL}, I_{IH}[1, 4]	Input or I/O Leakage	Clamp OFF and $V_{CCIO} < V_{IN} < V_{IH}$ (MAX)	—	—	+175	µA
		Clamp OFF and $V_{IN} = V_{CCIO}$	–10	—	10	µA
		Clamp OFF and V_{CCIO} - 0.97 V < V_{IN} < V_{CCIO}	–175	—	—	µA
		Clamp OFF and 0 V < V_{IN} < V_{CCIO} - 0.97 V	—	—	10	µA
		Clamp OFF and V_{IN} = GND	—	—	10	µA
		Clamp ON and 0 V < $V_{IN} < V_{CCIO}$	—	—	10	µA
I_{PU}	I/O Active Pull-up Current	0 < V_{IN} < 0.7 V_{CCIO}	–30	—	–309	µA
I_{PD}	I/O Active Pull-down Current	V_{IL} (MAX) < $V_{IN} < V_{CCIO}$	30	—	305	µA
I_{BHLS}	Bus Hold Low sustaining current	$V_{IN} = V_{IL}$ (MAX)	30	—	—	µA
I_{BHHS}	Bus Hold High sustaining current	$V_{IN} = 0.7V_{CCIO}$	–30	—	—	µA
I_{BHLO}	Bus Hold Low Overdrive current	0 ≤ V_{IN} ≤ V_{CCIO}	—	—	305	µA
I_{BHHO}	Bus Hold High Overdrive current	0 ≤ V_{IN} ≤ V_{CCIO}	—	—	–309	µA
V_{BHT}[3]	Bus Hold Trip Points		V_{IL} (MAX)	—	V_{IH} (MIN)	V
C1	I/O Capacitance[2]	V_{CCIO} = 3.3 V, 2.5 V, 1.8 V, 1.5 V, 1.2 V, V_{CC} = Typ., V_{IO} = 0 to V_{IH} (MAX)	3	5	9	pf
C2	Dedicated Input Capacitance[2]	V_{CCIO} = 3.3 V, 2.5 V, 1.8 V, 1.5 V, 1.2 V, V_{CC} = Typ., V_{IO} = 0 to V_{IH} (MAX)	3	5.5	7	pf
V_{HYST}	Hysteresis for Schmitt Trigger Inputs[5]	V_{CCIO} = 3.3 V, Hysteresis = Large	—	450	—	mV
		V_{CCIO} = 2.5 V, Hysteresis = Large	—	250	—	mV
		V_{CCIO} = 1.8 V, Hysteresis = Large	—	125	—	mV
		V_{CCIO} = 1.5 V, Hysteresis = Large	—	100	—	mV
		V_{CCIO} = 3.3 V, Hysteresis = Small	—	250	—	mV
		V_{CCIO} = 2.5 V, Hysteresis = Small	—	150	—	mV
		V_{CCIO} = 1.8 V, Hysteresis = Small	—	60	—	mV
		V_{CCIO} = 1.5 V, Hysteresis = Small	—	40	—	mV

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. T_A 25 °C, f = 1.0 MHz.
3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.
4. When V_{IH} is higher than V_{CCIO}, a transient current typically of 30 ns in duration or less with a peak current of 6mA can occur on the high-to-low transition. For true LVDS output pins in MachXO3L/LF devices, V_{IH} must be less than or equal to V_{CCIO}.
5. With bus keeper circuit turned on. For more details, refer to TN1280, MachXO3 sysIO Usage Guide.

1. MachXO3L/LF devices allow LVCMOS inputs to be placed in I/O banks where V_{CCIO} is different from what is specified in the applicable JEDEC specification. This is referred to as a ratioed input buffer. In a majority of cases this operation follows or exceeds the applicable JEDEC specification. The cases where MachXO3L/LF devices do not meet the relevant JEDEC specification are documented in the table below.
2. MachXO3L/LF devices allow for LVCMOS referenced I/Os which follow applicable JEDEC specifications. For more details about mixed mode operation please refer to please refer to TN1280, MachXO3 sysIO Usage Guide.
3. The dual function I^2C pins SCL and SDA are limited to a V_{IL} min of –0.25 V or to –0.3 V with a duration of <10 ns.
4. For electromigration, the average DC current sourced or sinked by I/O pads between two consecutive VCCIO or GND pad connections, or between the last VCCIO or GND in an I/O bank and the end of an I/O bank, as shown in the Logic Signal Connections table (also shown as I/O grouping) shall not exceed a maximum of n * 8 mA. “n” is the number of I/O pads between the two consecutive bank VCCIO or GND connections or between the last VCCIO and GND in a bank and the end of a bank. IO Grouping can be found in the Data Sheet Pin Tables, which can also be generated from the Lattice Diamond software.

BLVDS

The MachXO3L/LF family supports the BLVDS standard through emulation. The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs. The input standard is supported by the LVDS differential input buffer. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

Figure 3-2. BLVDS Multi-point Output Example

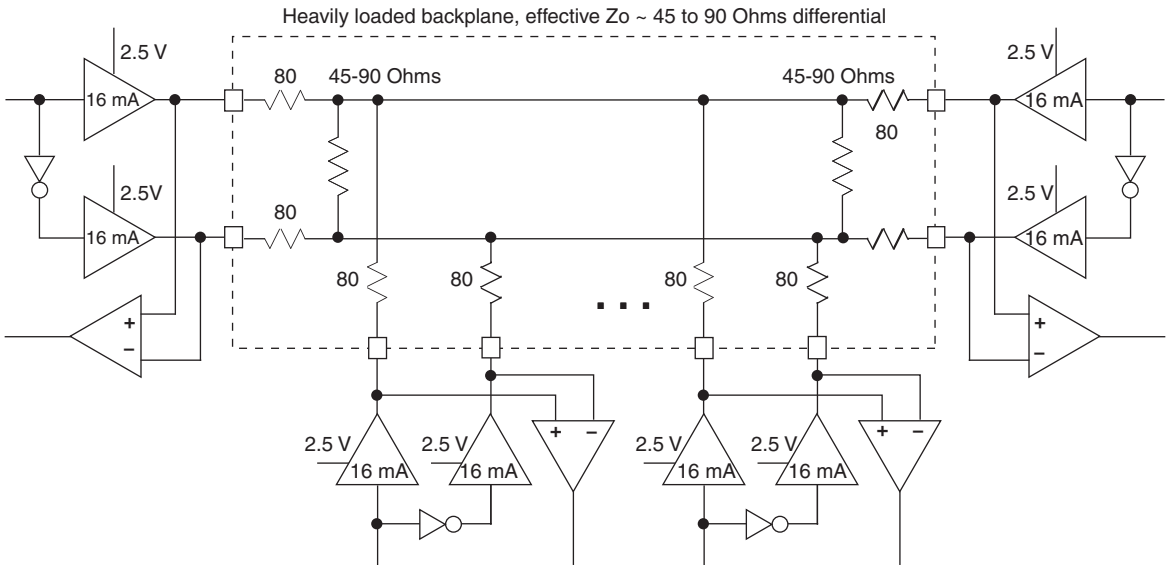

Table 3-2. BLVDS DC Conditions[1]

Over Recommended Operating Conditions

Symbol	Description	Nominal		Units
		Zo = 45	Zo = 90	
Z_{OUT}	Output impedance	20	20	Ohms
R_S	Driver series resistance	80	80	Ohms
R_{TLEFT}	Left end termination	45	90	Ohms

V_{OH}	Output high voltage	1.376	1.480	V
V_{OL}	Output low voltage	1.124	1.020	V
V_{OD}	Output differential voltage	0.253	0.459	V
V_{CM}	Output common mode voltage	1.250	1.250	V
I_{DC}	DC output current	11.236	10.204	mA

1. For input buffer, see LVDS table.

LVPECL

The MachXO3L/LF family supports the differential LVPECL standard through emulation. This output standard is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all the devices. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Differential LVPECL is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL

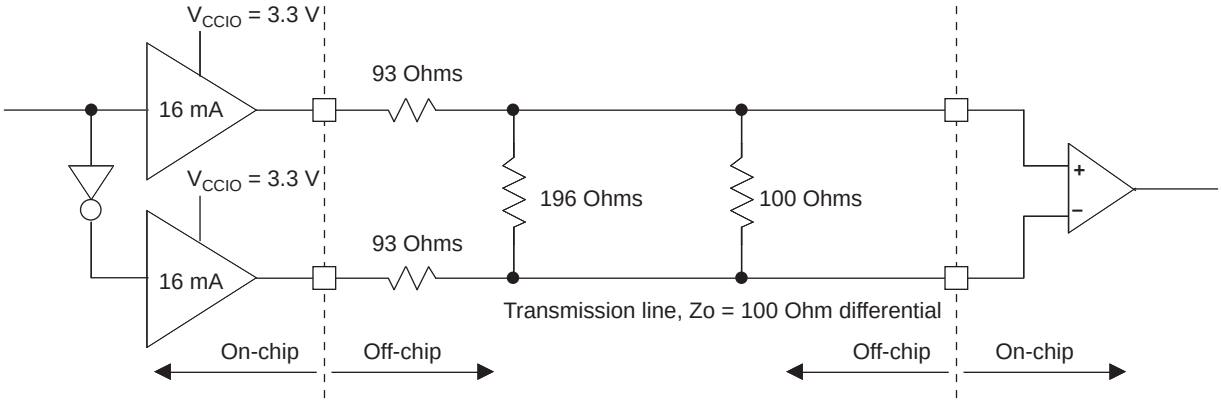

Table 3-3. LVPECL DC Conditions[1]

Over Recommended Operating Conditions

Symbol	Description	Nominal	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	93	Ohms
R_P	Driver parallel resistor	196	Ohms
R_T	Receiver termination	100	Ohms
V_{OH}	Output high voltage	2.05	V
V_{OL}	Output low voltage	1.25	V
V_{OD}	Output differential voltage	0.80	V
V_{CM}	Output common mode voltage	1.65	V
Z_{BACK}	Back impedance	100.5	Ohms
I_{DC}	DC output current	12.11	mA

1. For input buffer, see LVDS table.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

Table 3-5. MIPI D-PHY Output DC Conditions[1]

	Description	Min.	Typ.	Max.	Units
Transmitter					
External Termination					
RL	1% external resistor with VCCIO = 2.5 V	—	50	—	Ohms
	1% external resistor with VCCIO = 3.3 V	—	50	—	
RH	1% external resistor with performance up to 800 Mbps or with performance up 900 Mbps when VCCIO = 2.5 V	—	330	—	Ohms
	1% external resistor with performance between 800 Mbps to 900 Mbps when VCCIO = 3.3 V	—	464	—	Ohms
High Speed					
VCCIO	VCCIO of the Bank with LVDS Emulated output buffer	—	2.5	—	V
	VCCIO of the Bank with LVDS Emulated output buffer	—	3.3	—	V
VCMTX	HS transmit static common mode voltage	150	200	250	mV
VOD	HS transmit differential voltage	140	200	270	mV
VOHHS	HS output high voltage	—	—	360	V
ZOS	Single ended output impedance	—	50	—	Ohms
ΔZOS	Single ended output impedance mismatch	—	—	10	%
Low Power					
VCCIO	VCCIO of the Bank with LVCMOS12D 6 mA drive bidirectional IO buffer	—	1.2	—	V
VOH	Output high level	1.1	1.2	1.3	V
VOL	Output low level	–50	0	50	mV
ZOLP	Output impedance of LP transmitter	110	—	—	Ohms

1. Over Recommended Operating Conditions

MachXO3L/LF External Switching Characteristics – C/E Devices[1, 2, 3, 4, 5, 6, 10]

Over Recommended Operating Conditions

Parameter	Description	Device	–6		–5		Units
			Min.	Max.	Min.	Max.	
Clocks							
Primary Clocks							
f_{MAX_PRI}[7]	Frequency for Primary Clock Tree	All MachXO3L/LF devices	—	388	—	323	MHz
t_{W_PRI}	Clock Pulse Width for Primary Clock	All MachXO3L/LF devices	0.5	—	0.6	—	ns
t_{SKEW_PRI}	Primary Clock Skew Within a Device	MachXO3L/LF-1300	—	867	—	897	ps

Date	Version	Section	Change Summary
June 2014	1.0	—	Product name/trademark adjustment.
		Introduction	Updated Features section.
			Updated Table 1-1, MachXO3L Family Selection Guide. Changed fcCSP packages to csfBGA. Adjusted 121-ball csfBGA arrow.
			Introduction section general update.
		Architecture	General update.
		DC and Switching Characteristics	Updated sysIO Recommended Operating Conditions section. Removed V_{REF} (V) column. Added standards.
			Updated Maximum sysIO Buffer Performance section. Added MIPI I/O standard.
			Updated MIPI D-PHY Emulation section. Changed Low Speed to Low Power. Updated Table 3-4, MIPI DC Conditions.
			Updated Table 3-5, MIPI D-PHY Output DC Conditions.
			Updated Maximum sysIO Buffer Performance section.
			Updated MachXO3L External Switching Characteristics – C/E Device section.
May 2014	00.3	Introduction	Updated Features section.
			Updated Table 1-1, MachXO3L Family Selection Guide. Moved 121-ball fcCSP arrow.
			General update of Introduction section.
		Architecture	General update.
		Pinout Information	Updated Pin Information Summary section. Updated or added data on WLCSP49, WLCSP81, CABGA324, and CABGA400 for specific devices.
		Ordering Information	Updated MachXO3L Part Number Description section. Updated or added data on WLCSP49, WLCSP81, CABGA324, and CABGA400 for specific devices.
			Updated Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added part numbers.
February 2014	00.2	DC and Switching Characteristics	Updated MachXO3L External Switching Characteristics – C/E Devices table. Removed LPDDR and DDR2 parameters.
	00.1	—	Initial release.
