
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	540
Number of Logic Elements/Cells	4320
Total RAM Bits	94208
Number of I/O	206
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-VFBGA
Supplier Device Package	256-CSFBGA (9x9)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo3lf-4300e-5mg256c

MachXO3 Family Data Sheet Introduction

January 2016 | Advance Data Sheet DS1047

Features

- **Solutions**
  - Smallest footprint, lowest power, high data throughput bridging solutions for mobile applications
  - Optimized footprint, logic density, IO count, IO performance devices for IO management and logic applications
  - High IO/logic, lowest cost/IO, high IO devices for IO expansion applications
- **Flexible Architecture**
  - Logic Density ranging from 640 to 9.4K LUT4
  - High IO to LUT ratio with up to 384 IO pins
- **Advanced Packaging**
  - 0.4 mm pitch: 1K to 4K densities in very small footprint WLCSP (2.5 mm x 2.5 mm to 3.8 mm x 3.8 mm) with 28 to 63 IOs
  - 0.5 mm pitch: 640 to 6.9K LUT densities in 6 mm x 6 mm to 10 mm x 10 mm BGA packages with up to 281 IOs
  - 0.8 mm pitch: 1K to 9.4K densities with up to 384 IOs in BGA packages
- **Pre-Engineered Source Synchronous I/O**
  - DDR registers in I/O cells
  - Dedicated gearing logic
  - 7:1 Gearing for Display I/Os
  - Generic DDR, DDRx2, DDRx4
- **High Performance, Flexible I/O Buffer**
  - Programmable sysIO™ buffer supports wide range of interfaces:
    - — LVCMOS 3.3/2.5/1.8/1.5/1.2
    - — LVTTL
    - — LVDS, Bus-LVDS, MLVDS, LVPECL
    - — MIPI D-PHY Emulated
    - — Schmitt trigger inputs, up to 0.5 V hysteresis
  - Ideal for IO bridging applications
  - I/Os support hot socketing
  - On-chip differential termination
  - Programmable pull-up or pull-down mode
- **Flexible On-Chip Clocking**
  - Eight primary clocks
  - Up to two edge clocks for high-speed I/O interfaces (top and bottom sides only)
  - Up to two analog PLLs per device with fractional-n frequency synthesis
    - — Wide input frequency range (7 MHz to 400 MHz)
- **Non-volatile, Multi-time Programmable**
  - Instant-on
    - — Powers up in microseconds
  - Optional dual boot with external SPI memory
  - Single-chip, secure solution
  - Programmable through JTAG, SPI or I^2C
  - MachXO3L includes multi-time programmable NVCM
  - MachXO3LF infinitely reconfigurable Flash
    - — Supports background programming of non-volatile memory
- **TransFR Reconfiguration**
  - In-field logic update while IO holds the system state
- **Enhanced System Level Support**
  - On-chip hardened functions: SPI, I^2C, timer/counter
  - On-chip oscillator with 5.5% accuracy
  - Unique TraceID for system tracking
  - Single power supply with extended operating range
  - IEEE Standard 1149.1 boundary scan
  - IEEE 1532 compliant in-system programming
- **Applications**
  - Consumer Electronics
  - Compute and Storage
  - Wireless Communications
  - Industrial Control Systems
  - Automotive System
- **Low Cost Migration Path**
  - Migration from the Flash based MachXO3LF to the NVCM based MachXO3L
  - Pin compatible and equivalent timing

ROM Mode

ROM mode uses the LUT logic; hence, slices 0-3 can be used in ROM mode. Preloading is accomplished through the programming interface during PFU configuration.

For more information on the RAM and ROM modes, please refer to TN1290, Memory Usage Guide for MachXO3 Devices.

Routing

There are many resources provided in the MachXO3L/LF devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with three different types of routing resources: x1 (spans two PFUs), x2 (spans three PFUs) and x6 (spans seven PFUs). The x1, x2, and x6 connections provide fast and efficient connections in the horizontal and vertical directions.

The design tools take the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

Clock/Control Distribution Network

Each MachXO3L/LF device has eight clock inputs (PCLK [T, C] [Banknum]_[2..0]) – three pins on the left side, two pins each on the bottom and top sides and one pin on the right side. These clock inputs drive the clock nets. These eight inputs can be differential or single-ended and may be used as general purpose I/O if they are not used to drive the clock nets. When using a single ended clock input, only the PCLKT input can drive the clock tree directly.

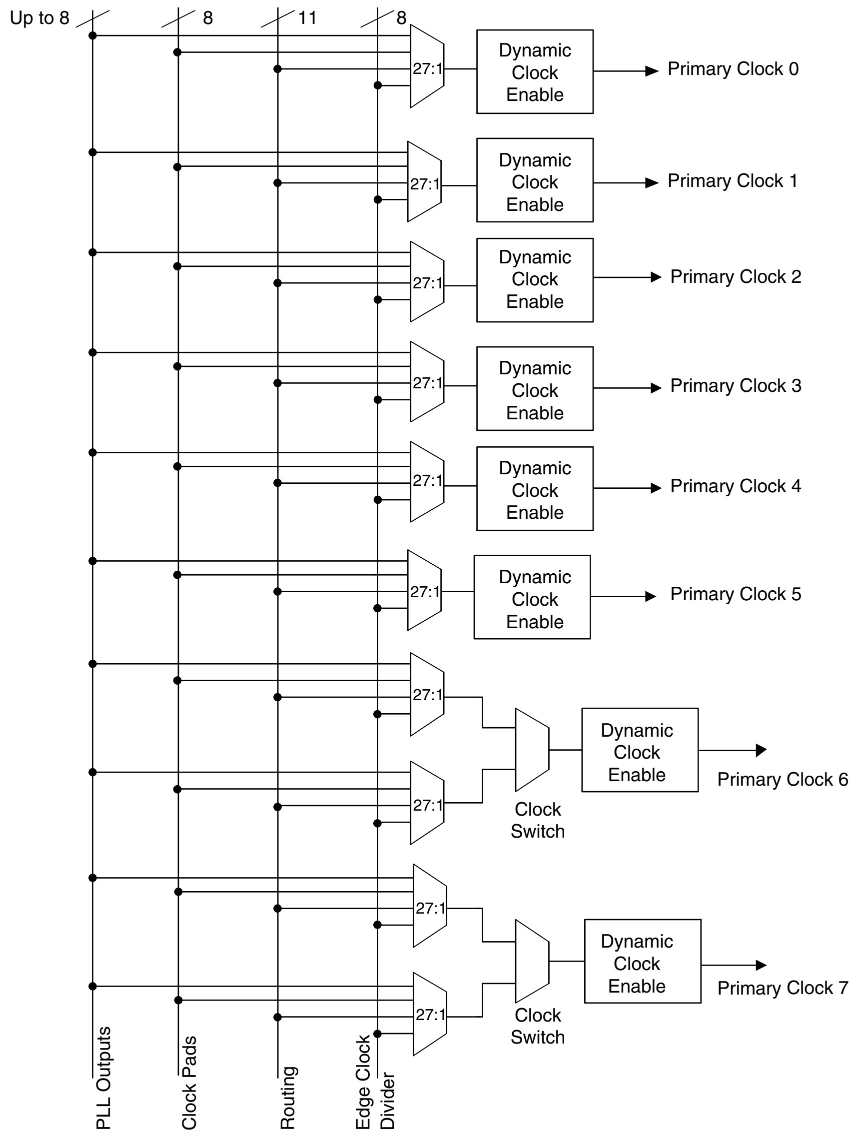
The MachXO3L/LF architecture has three types of clocking resources: edge clocks, primary clocks and secondary high fanout nets. MachXO3L/LF devices have two edge clocks each on the top and bottom edges. Edge clocks are used to clock I/O registers and have low injection time and skew. Edge clock inputs are from PLL outputs, primary clock pads, edge clock bridge outputs and CIB sources.

The eight primary clock lines in the primary clock network drive throughout the entire device and can provide clocks for all resources within the device including PFUs, EBRs and PICs. In addition to the primary clock signals, MachXO3L/LF devices also have eight secondary high fanout signals which can be used for global control signals, such as clock enables, synchronous or asynchronous clears, presets, output enables, etc. Internal logic can drive the global clock network for internally-generated global clocks and control signals.

The maximum frequency for the primary clock network is shown in the MachXO3L/LF External Switching Characteristics table.

Primary clock signals for the MachXO3L/LF-1300 and larger devices are generated from eight 27:1 muxes The available clock sources include eight I/O sources, 11 routing inputs, eight clock divider inputs and up to eight sysCLOCK PLL outputs.

Figure 2-5. Primary Clocks for MachXO3L/LF Devices



Eight secondary high fanout nets are generated from eight 8:1 muxes as shown in Figure 2-6. One of the eight inputs to the secondary high fanout net input mux comes from dual function clock pins and the remaining seven come from internal routing. The maximum frequency for the secondary clock network is shown in MachXO3L/LF External Switching Characteristics table.

Table 2-6. EBR Signal Descriptions

Port Name	Description	Active State
CLK	Clock	Rising Clock Edge
CE	Clock Enable	Active High
OCE[1]	Output Clock Enable	Active High
RST	Reset	Active High
BE[1]	Byte Enable	Active High
WE	Write Enable	Active High
AD	Address Bus	—
DI	Data In	—
DO	Data Out	—
CS	Chip Select	Active High
AFF	FIFO RAM Almost Full Flag	—
FF	FIFO RAM Full Flag	—
AEF	FIFO RAM Almost Empty Flag	—
EF	FIFO RAM Empty Flag	—
RPRST	FIFO RAM Read Pointer Reset	—

1. Optional signals.
2. For dual port EBR primitives a trailing ‘A’ or ‘B’ in the signal name specifies the EBR port A or port B respectively.
3. For FIFO RAM mode primitive, a trailing ‘R’ or ‘W’ in the signal name specifies the FIFO read port or write port respectively.
4. For FIFO RAM mode primitive FULLI has the same function as CSW(2) and EMPTYI has the same function as CSR(2).
5. In FIFO mode, CLKW is the write port clock, CSW is the write port chip select, CLKR is the read port clock, CSR is the read port chip select, ORE is the output read enable.

The EBR memory supports three forms of write behavior for single or dual port operation:

1. **Normal** – Data on the output appears only during the read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
2. **Write Through** – A copy of the input data appears at the output of the same port. This mode is supported for all data widths.
3. **Read-Before-Write** – When new data is being written, the old contents of the address appears at the output.

FIFO Configuration

The FIFO has a write port with data-in, CEW, WE and CLKW signals. There is a separate read port with data-out, RCE, RE and CLKR signals. The FIFO internally generates Almost Full, Full, Almost Empty and Empty Flags. The Full and Almost Full flags are registered with CLKW. The Empty and Almost Empty flags are registered with CLKR. Table 2-7 shows the range of programming values for these flags.

Table 2-7. Programmable FIFO Flag Ranges

Flag Name	Programming Range
Full (FF)	1 to max (up to 2^N-1)
Almost Full (AF)	1 to Full-1
Almost Empty (AE)	1 to Full-1
Empty (EF)	0

N = Address bit width.

The FIFO state machine supports two types of reset signals: RST and RPRST. The RST signal is a global reset that clears the contents of the FIFO by resetting the read/write pointer and puts the FIFO flags in their initial reset

Figure 2-15. MachXO3L/LF-1300 in 256 Ball Packages, MachXO3L/LF-2100, MachXO3L/LF-4300, MachXO3L/LF-6900 and MachXO3L/LF-9400 Banks

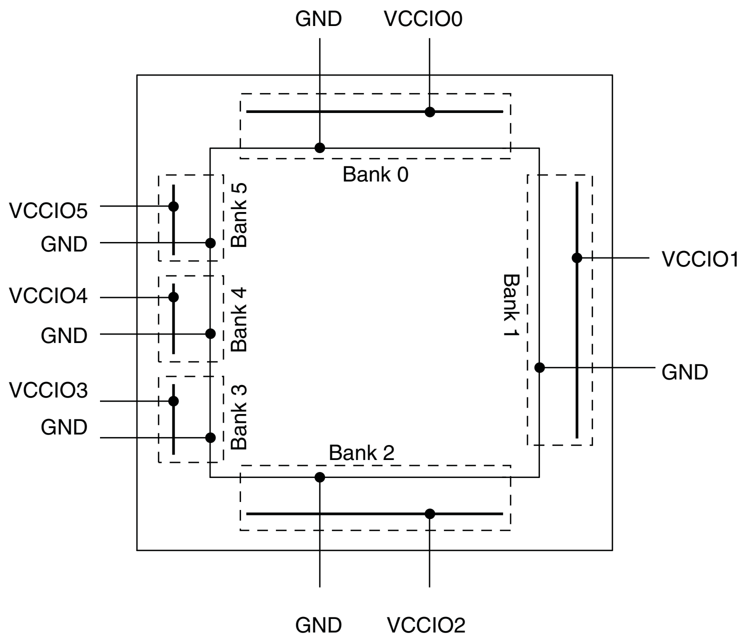


Figure 2-16. MachXO3L/LF-640 and MachXO3L/LF-1300 Banks

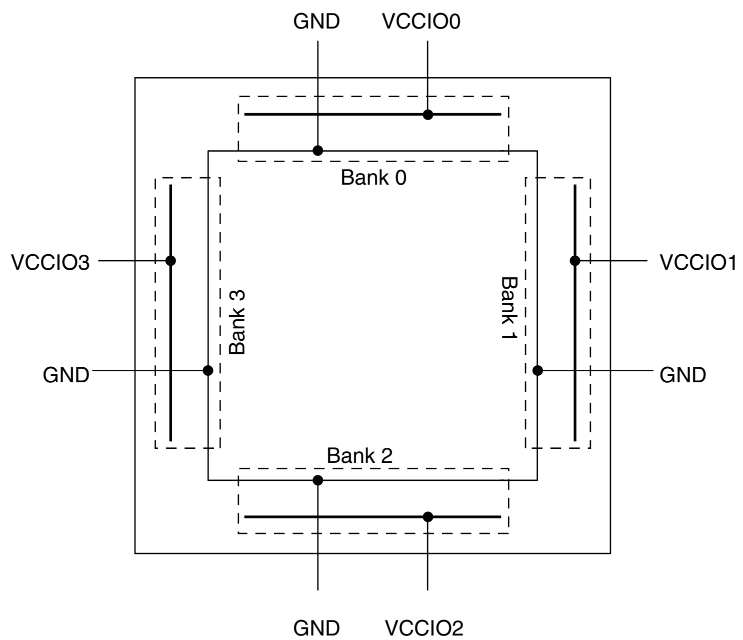

For more details on these embedded functions, please refer to TN1293, Using Hardened Control Functions in MachXO3 Devices.

User Flash Memory (UFM)

MachXO3LF devices provide a User Flash Memory block, which can be used for a variety of applications including storing a portion of the configuration image, initializing EBRs, to store PROM data or, as a general purpose user Flash memory. The UFM block connects to the device core through the embedded function block WISHBONE interface. Users can also access the UFM block through the JTAG, I2C and SPI interfaces of the device. The UFM block offers the following features:

- Non-volatile storage up to 256 kbits
- 100K write cycles
- Write access is performed page-wise; each page has 128 bits (16 bytes)
- Auto-increment addressing
- WISHBONE interface

For more information on the UFM, please refer to TN1293, Using Hardened Control Functions in MachXO3 Devices.

Standby Mode and Power Saving Options

MachXO3L/LF devices are available in two options, the C and E devices. The C devices have a built-in voltage regulator to allow for 2.5 V V_{CC} and 3.3 V V_{CC} while the E devices operate at 1.2 V V_{CC}.

MachXO3L/LF devices have been designed with features that allow users to meet the static and dynamic power requirements of their applications by controlling various device subsystems such as the bandgap, power-on-reset circuitry, I/O bank controllers, power guard, on-chip oscillator, PLLs, etc. In order to maximize power savings, MachXO3L/LF devices support a low power Stand-by mode.

In the stand-by mode the MachXO3L/LF devices are powered on and configured. Internal logic, I/Os and memories are switched on and remain operational, as the user logic waits for an external input. The device enters this mode when the standby input of the standby controller is toggled or when an appropriate I^2C or JTAG instruction is issued by an external master. Various subsystems in the device such as the band gap, power-on-reset circuitry etc can be configured such that they are automatically turned “off” or go into a low power consumption state to save power when the device enters this state. Note that the MachXO3L/LF devices are powered on when in standby mode and all power supplies should remain in the Recommended Operating Conditions.

Table 2-17. MachXO3L/LF Power Saving Features Description

Device Subsystem	Feature Description
Bandgap	The bandgap can be turned off in standby mode. When the Bandgap is turned off, analog circuitry such as the POR, PLLs, on-chip oscillator, and differential I/O buffers are also turned off. Bandgap can only be turned off for 1.2 V devices.
Power-On-Reset (POR)	The POR can be turned off in standby mode. This monitors VCC levels. In the event of unsafe V_{CC} drops, this circuit reconfigures the device. When the POR circuitry is turned off, limited power detector circuitry is still active. This option is only recommended for applications in which the power supply rails are reliable.
On-Chip Oscillator	The on-chip oscillator has two power saving features. It may be switched off if it is not needed in your design. It can also be turned off in Standby mode.
PLL	Similar to the on-chip oscillator, the PLL also has two power saving features. It can be statically switched off if it is not needed in a design. It can also be turned off in Standby mode. The PLL will wait until all output clocks from the PLL are driven low before powering off.
I/O Bank Controller	Differential I/O buffers (used to implement standards such as LVDS) consume more than ratioed single-ended I/Os such as LVCMOS and LVTTL. The I/O bank controller allows the user to turn these I/Os off dynamically on a per bank selection.
Dynamic Clock Enable for Primary Clock Nets	Each primary clock net can be dynamically disabled to save power.
Power Guard	Power Guard is a feature implemented in input buffers. This feature allows users to switch off the input buffer when it is not needed. This feature can be used in both clock and data paths. Its biggest impact is that in the standby mode it can be used to switch off clock inputs that are distributed using general routing resources.

For more details on the standby mode refer to TN1289, Power Estimation and Management for MachXO3 Devices.

Power On Reset

MachXO3L/LF devices have power-on reset circuitry to monitor V_{CCINT} and V_{CCIO} voltage levels during power-up and operation. At power-up, the POR circuitry monitors V_{CCINT} and V_{CCIO0} (controls configuration) voltage levels. It then triggers download from the on-chip configuration NVCM/Flash memory after reaching the V_{PORUP} level specified in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. For “E” devices without voltage regulators, V_{CCINT} is the same as the V_{CC} supply voltage. For “C” devices with voltage regulators, V_{CCINT} is regulated from the V_{CC} supply voltage. From this voltage reference, the time taken for configuration and entry into user mode is specified as NVCM/Flash Download Time ($t_{REFRESH}$) in the DC and Switching Characteristics section of this data sheet. Before and during configuration, the I/Os are held in tri-state. I/Os are released to user functionality once the device has finished configuration. Note that for “C” devices, a separate POR circuit monitors external V_{CC} voltage in addition to the POR circuit that monitors the internal post-regulated power supply voltage level.

Once the device enters into user mode, the POR circuitry can optionally continue to monitor V_{CCINT} levels. If V_{CCINT} drops below $V_{PORDNBG}$ level (with the bandgap circuitry switched on) or below $V_{PORDNSRAM}$ level (with the bandgap circuitry switched off to conserve power) device functionality cannot be guaranteed. In such a situation the POR issues a reset and begins monitoring the V_{CCINT} and V_{CCIO} voltage levels. $V_{PORDNBG}$ and $V_{PORDNSRAM}$ are both specified in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet.

Note that once an “E” device enters user mode, users can switch off the bandgap to conserve power. When the bandgap circuitry is switched off, the POR circuitry also shuts down. The device is designed such that a mini-mal, low power POR circuit is still operational (this corresponds to the $V_{PORDNSRAM}$ reset point described in the paragraph above). However this circuit is not as accurate as the one that operates when the bandgap is switched on. The low power POR circuit emulates an SRAM cell and is biased to trip before the vast majority of SRAM cells flip. If users are concerned about the V_{CC} supply dropping below V_{CC} (min) they should not shut down the bandgap or POR circuit.

Static Supply Current – C/E Devices[1, 2, 3, 6]

Symbol	Parameter	Device	Typ.[4]	Units
I_{CC}	Core Power Supply	LCMXO3L/LF-1300C 256 Ball Package	4.8	mA
		LCMXO3L/LF-2100C	4.8	mA
		LCMXO3L/LF-2100C 324 Ball Package	8.45	mA
		LCMXO3L/LF-4300C	8.45	mA
		LCMXO3L/LF-4300C 400 Ball Package	12.87	mA
		LCMXO3L/LF-6900C[7]	12.87	mA
		LCMXO3L/LF-9400C[7]	17.86	mA
		LCMXO3L/LF-640E	1.00	mA
		LCMXO3L/LF-1300E	1.00	mA
		LCMXO3L/LF-1300E 256 Ball Package	1.39	mA
		LCMXO3L/LF-2100E	1.39	mA
		LCMXO3L/LF-2100E 324 Ball Package	2.55	mA
		LCMXO3L/LF-4300E	2.55	mA
		LCMXO3L/LF-6900E	4.06	mA
		LCMXO3L/LF-9400E	5.66	mA
I_{CCIO}	Bank Power Supply[5] VCCIO = 2.5 V	All devices	0	mA

1. For further information on supply current, please refer to TN1289, Power Estimation and Management for MachXO3 Devices.
2. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip oscillator is off, on-chip PLL is off.
3. Frequency = 0 MHz.
4. T_J = 25 °C, power supplies at nominal voltage.
5. Does not include pull-up/pull-down.
6. To determine the MachXO3L/LF peak start-up current data, use the Power Calculator tool.
7. Determination of safe ambient operating conditions requires use of the Diamond Power Calculator tool.

sysIO Recommended Operating Conditions

Standard	V_{CCIO} (V)			V_{REF} (V)		
	Min.	Typ.	Max.	Min.	Typ.	Max.
LVCMOS 3.3	3.135	3.3	3.465	—	—	—

LVCMOS10R25[4]	2.375	2.5	2.625	0.35	0.5	0.65

1. Inputs on-chip. Outputs are implemented with the addition of external resistors.
2. For the dedicated LVDS buffers.
3. Requires the addition of external resistors.
4. Supported only for inputs and BIDIs for -6 speed grade devices.

sysIO Differential Electrical Characteristics

The LVDS differential output buffers are available on the top side of the MachXO3L/LF PLD family.

LVDS

Over Recommended Operating Conditions

Parameter Symbol	Parameter Description	Test Conditions	Min.	Typ.	Max.	Units
V_{INP}, V_{INM}	Input Voltage	V_{CCIO} = 3.3 V	0	—	2.605	V
		V_{CCIO} = 2.5 V	0	—	2.05	V
V_{THD}	Differential Input Threshold		±100	—		mV
V_{CM}	Input Common Mode Voltage	V_{CCIO} = 3.3 V	0.05	—	2.6	V
		V_{CCIO} = 2.5 V	0.05	—	2.0	V
I_{IN}	Input current	Power on	—	—	±10	µA
V_{OH}	Output high voltage for V_{OP} or V_{OM}	R_T = 100 Ohm	—	1.375	—	V
V_{OL}	Output low voltage for V_{OP} or V_{OM}	R_T = 100 Ohm	0.90	1.025	—	V
V_{OD}	Output voltage differential	(V_{OP} - V_{OM}), R_T = 100 Ohm	250	350	450	mV
ΔV_{OD}	Change in V_{OD} between high and low		—	—	50	mV
V_{OS}	Output voltage offset	(V_{OP} - V_{OM})/2, R_T = 100 Ohm	1.125	1.20	1.395	V
ΔV_{OS}	Change in V_{OS} between H and L		—	—	50	mV
I_{OSD}	Output short circuit current	V_{OD} = 0 V driver outputs shorted	—	—	24	mA

LVPECL

The MachXO3L/LF family supports the differential LVPECL standard through emulation. This output standard is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all the devices. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Differential LVPECL is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL

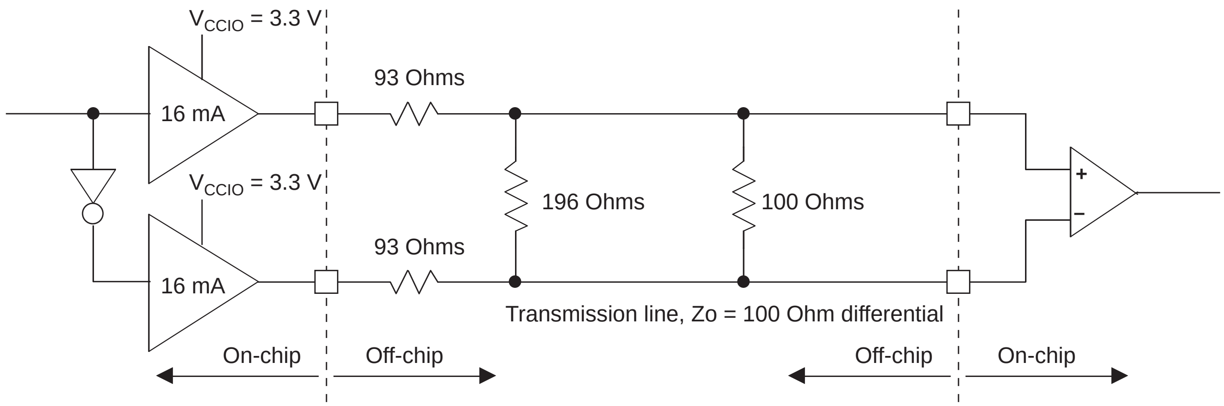

Table 3-3. LVPECL DC Conditions[1]

Over Recommended Operating Conditions

Symbol	Description	Nominal	Units
Z_{OUT}	Output impedance	20	Ohms
R_S	Driver series resistor	93	Ohms
R_P	Driver parallel resistor	196	Ohms

f_{MAX_IO}	Clock Frequency of I/O and PFU Register	All MachXO3L/LF devices	—	388	—	323	MHz

Parameter	Description	Device	–6		–5		Units
			Min.	Max.	Min.	Max.	
Generic DDRX1 Inputs with Clock and Data Aligned at Pin Using PCLK Pin for Clock Input – GDDRX1_RX.SCLK.Aligned[8, 9]							
t_{DVA}	Input Data Valid After CLK	All MachXO3L/LF devices, all sides	—	0.317	—	0.344	UI
t_{DVE}	Input Data Hold After CLK		0.742	—	0.702	—	UI
f_{DATA}	DDRX1 Input Data Speed		—	300	—	250	Mbps
f_{DDRX1}	DDRX1 SCLK Frequency		—	150	—	125	MHz
Generic DDRX1 Inputs with Clock and Data Centered at Pin Using PCLK Pin for Clock Input – GDDRX1_RX.SCLK.Centered[8, 9]							
t_{SU}	Input Data Setup Before CLK	All MachXO3L/LF devices, all sides	0.566	—	0.560	—	ns
t_{HO}	Input Data Hold After CLK		0.778	—	0.879	—	ns
f_{DATA}	DDRX1 Input Data Speed		—	300	—		Mbps
f_{DDRX1}	DDRX1 SCLK Frequency		—	150	—	125	MHz
Generic DDRX2 Inputs with Clock and Data Aligned at Pin Using PCLK Pin for Clock Input – GDDRX2_RX.ECLK.Aligned[8, 9]							
t_{DVA}	Input Data Valid After CLK	MachXO3L/LF devices, bottom side only	—	0.316	—	0.342	UI
t_{DVE}	Input Data Hold After CLK		0.710	—	0.675	—	UI
f_{DATA}	DDRX2 Serial Input Data Speed		—	664	—	554	Mbps
f_{DDRX2}	DDRX2 ECLK Frequency		—	332	—	277	MHz
f_{SCLK}	SCLK Frequency		—	166	—	139	MHz
Generic DDRX2 Inputs with Clock and Data Centered at Pin Using PCLK Pin for Clock Input – GDDRX2_RX.ECLK.Centered[8, 9]							
t_{SU}	Input Data Setup Before CLK	MachXO3L/LF devices, bottom side only	0.233	—	0.219	—	ns
t_{HO}	Input Data Hold After CLK		0.287	—	0.287	—	ns
f_{DATA}	DDRX2 Serial Input Data Speed		—	664	—	554	Mbps
f_{DDRX2}	DDRX2 ECLK Frequency		—	332	—	277	MHz
f_{SCLK}	SCLK Frequency		—	166	—	139	MHz
Generic DDR4 Inputs with Clock and Data Aligned at Pin Using PCLK Pin for Clock Input – GDDRX4_RX.ECLK.Aligned[8]							
t_{DVA}	Input Data Valid After ECLK	MachXO3L/LF devices, bottom side only	—	0.307	—	0.320	UI
t_{DVE}	Input Data Hold After ECLK		0.782	—	0.699	—	UI
f_{DATA}	DDRX4 Serial Input Data Speed		—	800	—	630	Mbps
f_{DDRX4}	DDRX4 ECLK Frequency		—	400	—	315	MHz
f_{SCLK}	SCLK Frequency		—	100	—	79	MHz
Generic DDR4 Inputs with Clock and Data Centered at Pin Using PCLK Pin for Clock Input – GDDRX4_RX.ECLK.Centered[8]							
t_{SU}	Input Data Setup Before ECLK	MachXO3L/LF devices, bottom side only	0.233	—	0.219	—	ns
t_{HO}	Input Data Hold After ECLK		0.287	—	0.287	—	ns
f_{DATA}	DDRX4 Serial Input Data Speed		—	800	—	630	Mbps
f_{DDRX4}	DDRX4 ECLK Frequency		—	400	—	315	MHz
f_{SCLK}	SCLK Frequency		—	100	—	79	MHz
7:1 LVDS Inputs (GDDR71_RX.ECLK.7:1)[9]							
t_{DVA}	Input Data Valid After ECLK	MachXO3L/LF devices, bottom side only	—	0.290	—	0.320	UI
t_{DVE}	Input Data Hold After ECLK		0.739	—	0.699	—	UI
f_{DATA}	DDR71 Serial Input Data Speed		—	756	—	630	Mbps
f_{DDR71}	DDR71 ECLK Frequency		—	378	—	315	MHz
f_{CLKIN}	7:1 Input Clock Frequency (SCLK) (minimum limited by PLL)		—	108	—	90	MHz

February 2017 Advance Data Sheet DS1047

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
P[Edge] [Row/Column Number]_[A/B/C/D]	I/O	[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top). [Row/Column Number] indicates the PFU row or the column of the device on which the PIO Group exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number. [A/B/C/D] indicates the PIO within the group to which the pad is connected. Some of these user-programmable pins are shared with special function pins. When not used as special function pins, these pins can be programmed as I/Os for user logic. During configuration of the user-programmable I/Os, the user has an option to tri-state the I/Os and enable an internal pull-up, pull-down or buskeeper resistor. This option also applies to unused pins (or those not bonded to a package pin). The default during configuration is for user-programmable I/Os to be tri-stated with an internal pull-down resistor enabled. When the device is erased, I/Os will be tri-stated with an internal pull-down resistor enabled. Some pins, such as PROGRAMN and JTAG pins, default to tri-stated I/Os with pull-up resistors enabled when the device is erased.
NC	—	No connect.
GND	—	GND – Ground. Dedicated pins. It is recommended that all GNDs are tied together.
VCC	—	V_{CC} – The power supply pins for core logic. Dedicated pins. It is recommended that all VCCs are tied to the same supply.
VCCIOx	—	VCCIO – The power supply pins for I/O Bank x. Dedicated pins. It is recommended that all VCCIOs located in the same bank are tied to the same supply.
PLL and Clock Functions (Used as user-programmable I/O pins when not used for PLL or clock pins)		
[LOC]_GPLL[T, C]_IN	—	Reference Clock (PLL) input pads: [LOC] indicates location. Valid designations are L (Left PLL) and R (Right PLL). T = true and C = complement.
[LOC]_GPLL[T, C]_FB	—	Optional Feedback (PLL) input pads: [LOC] indicates location. Valid designations are L (Left PLL) and R (Right PLL). T = true and C = complement.
PCLK [n]_[2:0]	—	Primary Clock pads. One to three clock pads per side.
Test and Programming (Dual function pins used for test access port and during sysCONFIG™)		
TMS	I	Test Mode Select input pin, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data input pin, used to load data into the device using an 1149.1 state machine.
TDO	O	Output pin – Test Data output pin used to shift data out of the device using 1149.1.
JTAGENB	I	Optionally controls behavior of TDI, TDO, TMS, TCK. If the device is configured to use the JTAG pins (TDI, TDO, TMS, TCK) as general purpose I/O, then: If JTAGENB is low: TDI, TDO, TMS and TCK can function a general purpose I/O. If JTAGENB is high: TDI, TDO, TMS and TCK function as JTAG pins. For more details, refer to TN1279, MachXO3 Programming and Configuration Usage Guide.

Signal Descriptions (Cont.)

Signal Name	I/O	Descriptions
Configuration (Dual function pins used during sysCONFIG)		
PROGRAMN	I	Initiates configuration sequence when asserted low. This pin always has an active pull-up.
INITN	I/O	Open Drain pin. Indicates the FPGA is ready to be configured. During configuration, a pull-up is enabled.
DONE	I/O	Open Drain pin. Indicates that the configuration sequence is complete, and the start-up sequence is in progress.
MCLK/CCLK	I/O	Input Configuration Clock for configuring an FPGA in Slave SPI mode. Output Configuration Clock for configuring an FPGA in SPI and SPIm configuration modes.
SN	I	Slave SPI active low chip select input.
CSSPIN	I/O	Master SPI active low chip select output.
SI/SPISI	I/O	Slave SPI serial data input and master SPI serial data output.
SO/SPISO	I/O	Slave SPI serial data output and master SPI serial data input.
SCL	I/O	Slave I^2C clock input and master I^2C clock output.
SDA	I/O	Slave I^2C data input and master I^2C data output.
