Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Features

■ Solutions

- Smallest footprint, lowest power, high data throughput bridging solutions for mobile applications
- Optimized footprint, logic density, IO count, IO performance devices for IO management and logic applications
- High IO/logic, lowest cost/IO, high IO devices for IO expansion applications

■ Flexible Architecture

- Logic Density ranging from 640 to 9.4K LUT4
- High IO to LUT ratio with up to 384 IO pins

■ Advanced Packaging

- 0.4 mm pitch: 1K to 4K densities in very small footprint WLCSP (2.5 mm x 2.5 mm to 3.8 mm x 3.8 mm) with 28 to 63 IOs
- 0.5 mm pitch: 640 to 6.9K LUT densities in 6 mm x 6 mm to 10 mm x 10 mm BGA packages with up to 281 IOs
- 0.8 mm pitch: 1K to 9.4K densities with up to 384 IOs in BGA packages

■ Pre-Engineered Source Synchronous I/O

- DDR registers in I/O cells
- Dedicated gearing logic
- 7:1 Gearing for Display I/Os
- Generic DDR, DDRx2, DDRx4

■ High Performance, Flexible I/O Buffer

- Programmable sysIO™ buffer supports wide range of interfaces:
 - LVCMOS 3.3/2.5/1.8/1.5/1.2
 - LVTTTL
 - LVDS, Bus-LVDS, MLVDS, LVPECL
 - MIPI D-PHY Emulated
 - Schmitt trigger inputs, up to 0.5 V hysteresis
- Ideal for IO bridging applications
- I/Os support hot socketing
- On-chip differential termination
- Programmable pull-up or pull-down mode

■ Flexible On-Chip Clocking

- Eight primary clocks
- Up to two edge clocks for high-speed I/O interfaces (top and bottom sides only)
- Up to two analog PLLs per device with fractional-n frequency synthesis
 - Wide input frequency range (7 MHz to 400 MHz)

■ Non-volatile, Multi-time Programmable

- Instant-on
 - Powers up in microseconds
- Optional dual boot with external SPI memory
- Single-chip, secure solution
- Programmable through JTAG, SPI or I²C
- MachXO3L includes multi-time programmable NVCM
- MachXO3LF infinitely reconfigurable Flash
 - Supports background programming of non-volatile memory

■ TransFR Reconfiguration

- In-field logic update while IO holds the system state

■ Enhanced System Level Support

- On-chip hardened functions: SPI, I²C, timer/counter
- On-chip oscillator with 5.5% accuracy
- Unique TraceID for system tracking
- Single power supply with extended operating range
- IEEE Standard 1149.1 boundary scan
- IEEE 1532 compliant in-system programming

■ Applications

- Consumer Electronics
- Compute and Storage
- Wireless Communications
- Industrial Control Systems
- Automotive System

■ Low Cost Migration Path

- Migration from the Flash based MachXO3LF to the NVCM based MachXO3L
- Pin compatible and equivalent timing

Architecture Overview

The MachXO3L/LF family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). All logic density devices in this family have sysCLOCK™ PLLs and blocks of sysMEM Embedded Block RAM (EBRs). Figure 2-1 and Figure 2-2 show the block diagrams of the various family members.

Figure 2-1. Top View of the MachXO3L/LF-1300 Device

Notes:

- MachXO3L/LF-640 is similar to MachXO3L/LF-1300. MachXO3L/LF-640 has a lower LUT count.
- MachXO3L devices have NVCM, MachXO3LF devices have Flash.

Figure 2-2. Top View of the MachXO3L/LF-4300 Device

Notes:

- MachXO3L/LF-1300, MachXO3L/LF-2100, MachXO3L/LF-6900 and MachXO3L/LF-9400 are similar to MachXO3L/LF-4300. MachXO3L/LF-1300 has a lower LUT count, one PLL, and seven EBR blocks. MachXO3L/LF-2100 has a lower LUT count, one PLL, and eight EBR blocks. MachXO3L/LF-6900 has a higher LUT count, two PLLs, and 26 EBR blocks. MachXO3L/LF-9400 has a higher LUT count, two PLLs, and 48 EBR blocks.
- MachXO3L devices have NVCM, MachXO3LF devices have Flash.

The logic blocks, Programmable Functional Unit (PFU) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each row has either the logic blocks or the EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the MachXO3L/LF family, the number of sysIO banks varies by device. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag “hard” control logic to minimize LUT usage.

The MachXO3L/LF registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

The MachXO3L/LF architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks. These blocks are located at the ends of the on-chip NVCM/Flash block. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

MachXO3L/LF devices provide commonly used hardened functions such as SPI controller, I²C controller and timer/counter.

MachXO3LF devices also provide User Flash Memory (UFM). These hardened functions and the UFM interface to the core logic and routing through a WISHBONE interface. The UFM can also be accessed through the SPI, I²C and JTAG ports.

Every device in the family has a JTAG port that supports programming and configuration of the device as well as access to the user logic. The MachXO3L/LF devices are available for operation from 3.3 V, 2.5 V and 1.2 V power supplies, providing easy integration into the overall system.

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode

In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode

Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Up/down counter with asynchronous clear
- Up/down counter with preload (sync)
- Ripple mode multiplier building block
- Multiplier support
- Comparator functions of A and B inputs
 - A greater-than-or-equal-to B
 - A not-equal-to B
 - A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO3L/LF devices support distributed memory initialization.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO3L/LF devices, please see TN1290, [Memory Usage Guide for MachXO3 Devices](#).

Figure 2-6. Secondary High Fanout Nets for MachXO3L/LF Devices

sysCLOCK Phase Locked Loops (PLLs)

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. All MachXO3L/LF devices have one or more sysCLOCK PLL. CLKI is the reference frequency input to the PLL and its source can come from an external I/O pin or from internal routing. CLKFB is the feedback signal to the PLL which can come from internal routing or an external I/O pin. The feedback divider is used to multiply the reference frequency and thus synthesize a higher frequency clock output.

The MachXO3L/LF sysCLOCK PLLs support high resolution (16-bit) fractional-N synthesis. Fractional-N frequency synthesis allows the user to generate an output clock which is a non-integer multiple of the input frequency. For more information about using the PLL with Fractional-N synthesis, please see TN1282, [MachXO3 sysCLOCK PLL Design and Usage Guide](#).

Each output has its own output divider, thus allowing the PLL to generate different frequencies for each output. The output dividers can have a value from 1 to 128. The output dividers may also be cascaded together to generate low frequency clocks. The CLKOP, CLKOS, CLKOS2, and CLKOS3 outputs can all be used to drive the MachXO3L/LF clock distribution network directly or general purpose routing resources can be used.

The LOCK signal is asserted when the PLL determines it has achieved lock and de-asserted if a loss of lock is detected. A block diagram of the PLL is shown in Figure 2-7.

The setup and hold times of the device can be improved by programming a phase shift into the CLKOS, CLKOS2, and CLKOS3 output clocks which will advance or delay the output clock with reference to the CLKOP output clock.

state. The RPRST signal is used to reset the read pointer. The purpose of this reset is to retransmit the data that is in the FIFO. In these applications it is important to keep careful track of when a packet is written into or read from the FIFO.

Memory Core Reset

The memory core contains data output latches for ports A and B. These are simple latches that can be reset synchronously or asynchronously. RSTA and RSTB are local signals, which reset the output latches associated with port A and port B respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-9.

Figure 2-9. Memory Core Reset

For further information on the sysMEM EBR block, please refer to TN1290, [Memory Usage Guide for MachXO3 Devices](#).

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-10. The GSR input to the EBR is always asynchronous.

Figure 2-10. EBR Asynchronous Reset (Including GSR) Timing Diagram

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/t_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. $T_A = 25^\circ C$, $f = 1.0 \text{ MHz}$.
3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.
4. When V_{IH} is higher than V_{CCIO} , a transient current typically of 30 ns in duration or less with a peak current of 6mA can occur on the high-to-low transition. For true LVDS output pins in MachXO3L/LF devices, V_{IH} must be less than or equal to V_{CCIO} .
5. With bus keeper circuit turned on. For more details, refer to TN1280, [MachXO3 sysIO Usage Guide](#).

LVPECL

The MachXO3L/LF family supports the differential LVPECL standard through emulation. This output standard is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all the devices. The LVPECL input standard is supported by the LVDS differential input buffer. The scheme shown in Differential LVPECL is one possible solution for point-to-point signals.

- Exact performance may vary with device and design implementation. Commercial timing numbers are shown at 85 °C and 1.14 V. Other operating conditions, including industrial, can be extracted from the Diamond software.
- General I/O timing numbers based on LVCMOS 2.5, 8 mA, 0pF load, fast slew rate.
- Generic DDR timing numbers based on LVDS I/O (for input, output, and clock ports).
- 7:1 LVDS (GDDR71) uses the LVDS I/O standard (for input, output, and clock ports).
- For Generic DDRX1 mode t_{SU} = t_{HO} = (t_{DVE} - t_{DVA} - 0.03 ns)/2.
- The t_{SU_DEL} and t_{H_DEL} values use the SCLK_ZERHOLD default step size. Each step is 105 ps (-6), 113 ps (-5), 120 ps (-4).
- This number for general purpose usage. Duty cycle tolerance is +/-10%.
- Duty cycle is +/- 5% for system usage.
- Performance is calculated with 0.225 UI.
- Performance is calculated with 0.20 UI.
- Performance for Industrial devices are only supported with VCC between 1.16 V to 1.24 V.
- Performance for Industrial devices and -5 devices are not modeled in the Diamond design tool.
- The above timing numbers are generated using the Diamond design tool. Exact performance may vary with the device selected.
- Above 800 Mbps is only supported with WLCSP and csfBGA packages
- Between 800 Mbps to 900 Mbps:
 - VIDTH exceeds the MIPI D-PHY Input DC Conditions Table 3-4 and can be calculated with the equation t_{SU} or t_H = -0.0005*VIDTH + 0.3284
 - Example calculations
 - t_{SU} and t_{HO} = 0.28 with VIDTH = 100 mV
 - t_{SU} and t_{HO} = 0.25 with VIDTH = 170 mV
 - t_{SU} and t_{HO} = 0.20 with VIDTH = 270 mV

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
P[Edge] [Row/Column Number]_[A/B/C/D]	I/O	<p>[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top).</p> <p>[Row/Column Number] indicates the PFU row or the column of the device on which the PIO Group exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number.</p> <p>[A/B/C/D] indicates the PIO within the group to which the pad is connected.</p> <p>Some of these user-programmable pins are shared with special function pins. When not used as special function pins, these pins can be programmed as I/Os for user logic.</p> <p>During configuration of the user-programmable I/Os, the user has an option to tri-state the I/Os and enable an internal pull-up, pull-down or buskeeper resistor. This option also applies to unused pins (or those not bonded to a package pin). The default during configuration is for user-programmable I/Os to be tri-stated with an internal pull-down resistor enabled. When the device is erased, I/Os will be tri-stated with an internal pull-down resistor enabled. Some pins, such as PROGRAMN and JTAG pins, default to tri-stated I/Os with pull-up resistors enabled when the device is erased.</p>

VCCIOx	—	VCCIO – The power supply pins for I/O Bank x. Dedicated pins. It is recommended that all VCCIOs located in the same bank are tied to the same supply.
PLL and Clock Functions (Used as user-programmable I/O pins when not used for PLL or clock pins)		
[LOC]_GPLL[T, C]_IN	—	Reference Clock (PLL) input pads: [LOC] indicates location. Valid designations are L (Left PLL) and R (Right PLL). T = true and C = complement.
[LOC]_GPLL[T, C]_FB	—	Optional Feedback (PLL) input pads: [LOC] indicates location. Valid designations are L (Left PLL) and R (Right PLL). T = true and C = complement.
PCLK [n]_[2:0]	—	Primary Clock pads. One to three clock pads per side.
Test and Programming (Dual function pins used for test access port and during sysCONFIG™)		
TMS	I	Test Mode Select input pin, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data input pin, used to load data into the device using an 1149.1 state machine.
TDO	O	Output pin – Test Data output pin used to shift data out of the device using 1149.1.
JTAGENB	I	<p>Optionally controls behavior of TDI, TDO, TMS, TCK. If the device is configured to use the JTAG pins (TDI, TDO, TMS, TCK) as general purpose I/O, then:</p> <p>If JTAGENB is low: TDI, TDO, TMS and TCK can function a general purpose I/O.</p> <p>If JTAGENB is high: TDI, TDO, TMS and TCK function as JTAG pins.</p> <p>For more details, refer to TN1279, MachXO3 Programming and Configuration Usage Guide.</p>
