Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	1175
Number of Logic Elements/Cells	9400
Total RAM Bits	442368
Number of I/O	335
Number of Gates	-
Voltage - Supply	2.375V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	400-LFBGA
Supplier Device Package	400-CABGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo3lf-9400c-5bg400i

Figure 2-2. Top View of the MachXO3L/LF-4300 Device
Notes:
• MachXO3L/LF-1300, MachXO3L/LF-2100, MachXO3L/LF-6900 and MachXO3L/LF-9400 are similar to MachXO3L/LF-4300. MachXO3L/LF-1300 has a lower LUT count, one PLL, and seven EBR blocks. MachXO3L/LF-2100 has a lower LUT count, one PLL, and eight EBR blocks. MachXO3L/LF-6900 has a higher LUT count, two PLLs, and 26 EBR blocks. MachXO3L/LF-9400 has a higher LUT count, two PLLs, and 48 EBR blocks.
• MachXO3L devices have NVCM, MachXO3LF devices have Flash.

The logic blocks, Programmable Functional Unit (PFU) and sysMEM EBR blocks, are arranged in a two-dimensional grid with rows and columns. Each row has either the logic blocks or the EBR blocks. The PIO cells are located at the periphery of the device, arranged in banks. The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PIOs utilize a flexible I/O buffer referred to as a sysIO buffer that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

In the MachXO3L/LF family, the number of sysIO banks varies by device. There are different types of I/O buffers on the different banks. Refer to the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag "hard" control logic to minimize LUT usage.

The MachXO3L/LF registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

The MachXO3L/LF architecture also provides up to two sysCLOCK Phase Locked Loop (PLL) blocks. These blocks are located at the ends of the on-chip NVCM/Flash block. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

MachXO3L/LF devices provide commonly used hardened functions such as SPI controller, I^2C controller and timer/counter.

MachXO3LF devices also provide User Flash Memory (UFM). These hardened functions and the UFM interface to the core logic and routing through a WISHBONE interface. The UFM can also be accessed through the SPI, I^2C and JTAG ports.

Every device in the family has a JTAG port that supports programming and configuration of the device as well as access to the user logic. The MachXO3L/LF devices are available for operation from 3.3 V, 2.5 V and 1.2 V power sup-plies, providing easy integration into the overall system.

Modes of Operation

Each slice has up to four potential modes of operation: Logic, Ripple, RAM and ROM.

Logic Mode

In this mode, the LUTs in each slice are configured as 4-input combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any four input logic functions can be generated by programming this lookup table. Since there are two LUT4s per slice, a LUT5 can be constructed within one slice. Larger look-up tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other slices. Note LUT8 requires more than four slices.

Ripple Mode

Ripple mode supports the efficient implementation of small arithmetic functions. In Ripple mode, the following functions can be implemented by each slice:

- Addition 2-bit

- Subtraction 2-bit

- Add/subtract 2-bit using dynamic control

- Up counter 2-bit

- Down counter 2-bit

- Up/down counter with asynchronous clear

- Up/down counter with preload (sync)

- Ripple mode multiplier building block

- Multiplier support

- Comparator functions of A and B inputs
  — A greater-than-or-equal-to B
  — A not-equal-to B
  — A less-than-or-equal-to B

Ripple mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per-slice basis to allow fast arithmetic functions to be constructed by concatenating slices.

RAM Mode

In this mode, a 16x4-bit distributed single port RAM (SPR) can be constructed by using each LUT block in Slice 0 and Slice 1 as a 16x1-bit memory. Slice 2 is used to provide memory address and control signals.

MachXO3L/LF devices support distributed memory initialization.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of slices required to implement different distributed RAM primitives. For more information about using RAM in MachXO3L/LF devices, please see TN1290, Memory Usage Guide for MachXO3 Devices.

Table 2-3. Number of Slices Required For Implementing Distributed RAM

	SPR 16x4	PDPR 16x4
Number of slices	3	3

Note: SPR = Single Port RAM, PDPR = Pseudo Dual Port RAM

Table 2-4. PLL Signal Descriptions (Continued)

Port Name	I/O	Description
CLKOP	O	Primary PLL output clock (with phase shift adjustment)
CLKOS	O	Secondary PLL output clock (with phase shift adjust)
CLKOS2	O	Secondary PLL output clock2 (with phase shift adjust)
CLKOS3	O	Secondary PLL output clock3 (with phase shift adjust)
LOCK	O	PLL LOCK, asynchronous signal. Active high indicates PLL is locked to input and feed-back signals.
DPHSRC	O	Dynamic Phase source – ports or WISHBONE is active
STDBY	I	Standby signal to power down the PLL
RST	I	PLL reset without resetting the M-divider. Active high reset.
RESETM	I	PLL reset - includes resetting the M-divider. Active high reset.
RESETC	I	Reset for CLKOS2 output divider only. Active high reset.
RESETD	I	Reset for CLKOS3 output divider only. Active high reset.
ENCLKOP	I	Enable PLL output CLKOP
ENCLKOS	I	Enable PLL output CLKOS when port is active
ENCLKOS2	I	Enable PLL output CLKOS2 when port is active
ENCLKOS3	I	Enable PLL output CLKOS3 when port is active
PLLCLK	I	PLL data bus clock input signal
PLLRST	I	PLL data bus reset. This resets only the data bus not any register values.
PLLSTB	I	PLL data bus strobe signal
PLLWE	I	PLL data bus write enable signal
PLLADDR [4:0]	I	PLL data bus address
PLLDATI [7:0]	I	PLL data bus data input
PLLDATO [7:0]	O	PLL data bus data output
PLLACK	O	PLL data bus acknowledge signal

sysMEM Embedded Block RAM Memory

The MachXO3L/LF devices contain sysMEM Embedded Block RAMs (EBRs). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers. This memory can be used for a wide variety of purposes including data buffering, PROM for the soft processor and FIFO.

sysMEM Memory Block
The sysMEM block can implement single port, dual port, pseudo dual port, or FIFO memories. Each block can be used in a variety of depths and widths as shown in Table 2-5.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device wake up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-10. The reset timing rules apply to the RPReset input versus the RE input and the RST input versus the WE and RE inputs. Both RST and RPReset are always asynchronous EBR inputs. For more details refer to TN1290, Memory Usage Guide for MachXO3 Devices.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

Programmable I/O Cells (PIC)

The programmable logic associated with an I/O is called a PIO. The individual PIO are connected to their respective sysIO buffers and pads. On the MachXO3L/LF devices, the PIO cells are assembled into groups of four PIO cells called a Programmable I/O Cell or PIC. The PICs are placed on all four sides of the device.

On all the MachXO3L/LF devices, two adjacent PIOs can be combined to provide a complementary output driver pair.

All PIO pairs can implement differential receivers. Half of the PIO pairs on the top edge of these devices can be configured as true LVDS transmit pairs. The PIO pairs on the bottom edge of these devices have on-chip differential termination and also provide PCI support.

sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in groups referred to as banks. The sysIO buffers allow users to implement a wide variety of standards that are found in today's systems including LVCMOS, TTL, PCI, LVDS, BLVDS, MLVDS and LVPECL.

Each bank is capable of supporting multiple I/O standards. In the MachXO3L/LF devices, single-ended output buffers, ratioed input buffers (LVTTL, LVCMOS and PCI), differential (LVDS) input buffers are powered using I/O supply voltage (V_{CCIO}). Each sysIO bank has its own V_{CCIO}.

MachXO3L/LF devices contain three types of sysIO buffer pairs.

1. **Left and Right sysIO Buffer Pairs**
   The sysIO buffer pairs in the left and right banks of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the left and right of the devices also have differential input buffers.

2. **Bottom sysIO Buffer Pairs**
   The sysIO buffer pairs in the bottom bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the bottom also have differential input buffers. Only the I/Os on the bottom banks have programmable PCI clamps and differential input termination. The PCI clamp is enabled after V_{CC} and V_{CCIO} are at valid operating levels and the device has been configured.

3. **Top sysIO Buffer Pairs**
   The sysIO buffer pairs in the top bank of the device consist of two single-ended output drivers and two single-ended input buffers (for ratioed inputs such as LVCMOS and LVTTL). The I/O pairs on the top also have differential I/O buffers. Half of the sysIO buffer pairs on the top edge have true differential outputs. The sysIO buffer pair comprising of the A and B PIOs in every PIC on the top edge have a differential output driver.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCIO0} have reached V_{PORUP} level defined in the Power-On-Reset Voltage table in the DC and Switching Characteristics section of this data sheet. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-down to GND (some pins such as PROGRAMN and the JTAG pins have weak pull-up to V_{CCIO} as the default functionality). The I/O pins will maintain the blank configuration until V_{CC} and V_{CCIO} (for I/O banks containing configuration I/Os) have reached V_{PORUP} levels at which time the I/Os will take on the user-configured settings only after a proper download/configuration.

There are various ways a user can ensure that there are no spurious signals on critical outputs as the device powers up. These are discussed in more detail in TN1280, MachXO3 sysIO Usage Guide.

Supported Standards

The MachXO3L/LF sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS, LVTTL, and PCI. The buffer supports the LVTTL, PCI, LVCMOS 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS, MLVDS and LVPECL output emulation is supported on all devices. The MachXO3L/LF devices support on-chip LVDS output buffers on approximately 50% of the I/Os on the top bank. Differential receivers for LVDS, BLVDS, MLVDS and LVPECL are supported on all banks of MachXO3L/LF devices. PCI support is provided in the bottom bank of the MachXO3L/LF devices. Table 2-11 summarizes the I/O characteristics of the MachXO3L/LF PLDs.

Embedded Hardened IP Functions

All MachXO3L/LF devices provide embedded hardened functions such as SPI, I^2C and Timer/Counter. MachXO3LF devices also provide User Flash Memory (UFM). These embedded blocks interface through the WISHBONE interface with routing as shown in Figure 2-17.

Figure 2-17. Embedded Function Block Interface
Hardened I^2C IP Core

Every MachXO3L/LF device contains two I^2C IP cores. These are the primary and secondary I^2C IP cores. Either of the two cores can be configured either as an I^2C master or as an I^2C slave. The only difference between the two IP cores is that the primary core has pre-assigned I/O pins whereas users can assign I/O pins for the secondary core.

When the IP core is configured as a master it will be able to control other devices on the I^2C bus through the interface. When the core is configured as the slave, the device will be able to provide I/O expansion to an I^2C Master. The I^2C cores support the following functionality:

- Master and Slave operation

- 7-bit and 10-bit addressing

- Multi-master arbitration support

- Up to 400 kHz data transfer speed

- General call support

- Interface to custom logic through 8-bit WISHBONE interface

There are some limitations on the use of the hardened user SPI. These are defined in the following technical notes:

- TN1087, Minimizing System Interruption During Configuration Using TransFR Technology (Appendix B)
- TN1293, Using Hardened Control Functions in MachXO3 Devices

Figure 2-19. SPI Core Block Diagram
Table 2-15 describes the signals interfacing with the SPI cores.

Table 2-15. SPI Core Signal Description

Signal Name	I/O	Master/Slave	Description
spi_csn[0]	O	Master	SPI master chip-select output
spi_csn[1..7]	O	Master	Additional SPI chip-select outputs (total up to eight slaves)
spi_scsn	I	Slave	SPI slave chip-select input
spi_irq	O	Master/Slave	Interrupt request
spi_clk	I/O	Master/Slave	SPI clock. Output in master mode. Input in slave mode.
spi_miso	I/O	Master/Slave	SPI data. Input in master mode. Output in slave mode.
spi_mosi	I/O	Master/Slave	SPI data. Output in master mode. Input in slave mode.
sn	I	Slave	Configuration Slave Chip Select (active low), dedicated for selecting the Configuration Logic.
cfg_stdby	O	Master/Slave	Stand-by signal – To be connected only to the power module of the MachXO3L/LF device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, SPI Tab.
cfg_wake	O	Master/Slave	Wake-up signal – To be connected only to the power module of the MachXO3L/LF device. The signal is enabled only if the "Wakeup Enable" feature has been set within the EFB GUI, SPI Tab.

Static Supply Current – C/E Devices[1, 2, 3, 6]

Symbol	Parameter	Device	Typ.[4]	Units
I_{CC}	Core Power Supply	LCMXO3L/LF-1300C 256 Ball Package	4.8	mA
		LCMXO3L/LF-2100C	4.8	mA
		LCMXO3L/LF-2100C 324 Ball Package	8.45	mA
		LCMXO3L/LF-4300C	8.45	mA
		LCMXO3L/LF-4300C 400 Ball Package	12.87	mA
		LCMXO3L/LF-6900C[7]	12.87	mA
		LCMXO3L/LF-9400C[7]	17.86	mA
		LCMXO3L/LF-640E	1.00	mA
		LCMXO3L/LF-1300E	1.00	mA
		LCMXO3L/LF-1300E 256 Ball Package	1.39	mA
		LCMXO3L/LF-2100E	1.39	mA
		LCMXO3L/LF-2100E 324 Ball Package	2.55	mA
		LCMXO3L/LF-4300E	2.55	mA
		LCMXO3L/LF-6900E	4.06	mA
		LCMXO3L/LF-9400E	5.66	mA
I_{CCIO}	Bank Power Supply[5] VCCIO = 2.5 V	All devices	0	mA

1. For further information on supply current, please refer to TN1289, Power Estimation and Management for MachXO3 Devices.
2. Assumes blank pattern with the following characteristics: all outputs are tri-stated, all inputs are configured as LVCMOS and held at V_{CCIO} or GND, on-chip oscillator is off, on-chip PLL is off.
3. Frequency = 0 MHz.
4. T_J = 25 °C, power supplies at nominal voltage.
5. Does not include pull-up/pull-down.
6. To determine the MachXO3L/LF peak start-up current data, use the Power Calculator tool.
7. Determination of safe ambient operating conditions requires use of the Diamond Power Calculator tool.

BLVDS

The MachXO3L/LF family supports the BLVDS standard through emulation. The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs. The input standard is supported by the LVDS differential input buffer. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

Figure 3-2. BLVDS Multi-point Output Example
Table 3-2. BLVDS DC Conditions[1]

Over Recommended Operating Conditions

Symbol	Description	Nominal		Units
		Zo = 45	Zo = 90	
Z_{OUT}	Output impedance	20	20	Ohms
R_S	Driver series resistance	80	80	Ohms
R_{TLEFT}	Left end termination	45	90	Ohms
R_{TRIGHT}	Right end termination	45	90	Ohms
V_{OH}	Output high voltage	1.376	1.480	V
V_{OL}	Output low voltage	1.124	1.020	V
V_{OD}	Output differential voltage	0.253	0.459	V
V_{CM}	Output common mode voltage	1.250	1.250	V
I_{DC}	DC output current	11.236	10.204	mA

1. For input buffer, see LVDS table.

Typical Building Block Function Performance – C/E Devices[1]

Pin-to-Pin Performance (LVCMOS25 12 mA Drive)

Function	–6 Timing	Units
Basic Functions		
16-bit decoder	8.9	ns
4:1 MUX	7.5	ns
16:1 MUX	8.3	ns

Register-to-Register Performance

Function	–6 Timing	Units
Basic Functions		
16:1 MUX	412	MHz
16-bit adder	297	MHz
16-bit counter	324	MHz
64-bit counter	161	MHz
Embedded Memory Functions		
1024x9 True-Dual Port RAM (Write Through or Normal, EBR output registers)	183	MHz
Distributed Memory Functions		
16x4 Pseudo-Dual Port RAM (one PFU)	500	MHz

1. The above timing numbers are generated using the Diamond design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device. Commercial timing numbers are shown at 85 °C and 1.14 V. Other operating conditions, including industrial, can be extracted from the Diamond software.

Derating Logic Timing

Logic timing provided in the following sections of the data sheet and the Lattice design tools are worst case numbers in the operating range. Actual delays may be much faster. Lattice design tools can provide logic timing numbers at a particular temperature and voltage.

Maximum sysIO Buffer Performance

I/O Standard	Max. Speed	Units

I²C Port Timing Specifications[1, 2]

Symbol	Parameter	Min.	Max.	Units
f_{MAX}	Maximum SCL clock frequency	—	400	kHz

1. MachXO3L/LF supports the following modes:
    - Standard-mode (Sm), with a bit rate up to 100 kbit/s (user and configuration mode)
    - Fast-mode (Fm), with a bit rate up to 400 kbit/s (user and configuration mode)
2. Refer to the I²C specification for timing requirements.

SPI Port Timing Specifications[1]

Symbol	Parameter	Min.	Max.	Units
f_{MAX}	Maximum SCK clock frequency	—	45	MHz

1. Applies to user mode only. For configuration mode timing specifications, refer to sysCONFIG Port Timing Specifications table in this data sheet.

Switching Test Conditions

Figure 3-9 shows the output test load used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3-6.

Figure 3-9. Output Test Load, LVTTL and LVCMOS Standards
Table 3-6. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R1	CL	Timing Ref.	VT
LVTTL and LVCMOS settings (L -> H, H -> L)	∞	0pF	LVTTL, LVCMOS 3.3 = 1.5 V	—
			LVCMOS 2.5 = V_{CCIO}/2	—
			LVCMOS 1.8 = V_{CCIO}/2	—
			LVCMOS 1.5 = V_{CCIO}/2	—
			LVCMOS 1.2 = V_{CCIO}/2	—
LVTTL and LVCMOS 3.3 (Z -> H)	188	0pF	1.5	V_{OL}
LVTTL and LVCMOS 3.3 (Z -> L)			1.5	V_{OH}
Other LVCMOS (Z -> H)			V_{CCIO}/2	V_{OL}
Other LVCMOS (Z -> L)			V_{CCIO}/2	V_{OH}
LVTTL + LVCMOS (H -> Z)			V_{OH} - 0.15	V_{OL}
LVTTL + LVCMOS (L -> Z)			V_{OL} - 0.15	V_{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

Signal Descriptions (Cont.)

Signal Name	I/O	Descriptions
Configuration (Dual function pins used during sysCONFIG)		
PROGRAMN	I	Initiates configuration sequence when asserted low. This pin always has an active pull-up.
INITN	I/O	Open Drain pin. Indicates the FPGA is ready to be configured. During configuration, a pull-up is enabled.
DONE	I/O	Open Drain pin. Indicates that the configuration sequence is complete, and the start-up sequence is in progress.
MCLK/CCLK	I/O	Input Configuration Clock for configuring an FPGA in Slave SPI mode. Output Configuration Clock for configuring an FPGA in SPI and SPIm configuration modes.
SN	I	Slave SPI active low chip select input.
CSSPIN	I/O	Master SPI active low chip select output.
SI/SPISI	I/O	Slave SPI serial data input and master SPI serial data output.
SO/SPISO	I/O	Slave SPI serial data output and master SPI serial data input.
SCL	I/O	Slave I^{2}C clock input and master I^{2}C clock output.
SDA	I/O	Slave I^{2}C data input and master I^{2}C data output.

Date	Version	Section	Change Summary
February 2017	1.8	Architecture	Updated Supported Standards section. Corrected "MDVS" to "MLDVS" in Table 2-11, Supported Input Standards.
		DC and Switching Characteristics	Updated ESD Performance section. Added reference to the MachXO2 Product Family Qualification Summary document.
			Updated Static Supply Current – C/E Devices section. Added footnote 7.
			Updated MachXO3L/LF External Switching Characteristics – C/E Devices section. — Populated values for MachXO3L/LF-9400. — Under 7:1 LVDS Outputs – GDDR71_TX.ECLK.7:1, corrected "t_{DVB}" to "t_{DIB}" and "t_{DVA}" to "t_{DIA}" and revised their descriptions. — Added Figure 3-6, Receiver GDDR71_RX Waveforms and Figure 3-7, Transmitter GDDR71_TX Waveforms.
		Pinout Information	Updated the Pin Information Summary section. Added MachXO3L/LF-9600C packages.
May 2016	1.7	DC and Switching Characteristics	Updated Absolute Maximum Ratings section. Modified I/O Tri-state Voltage Applied and Dedicated Input Voltage Applied footnotes.
			Updated sysIO Recommended Operating Conditions section. — Added standards. — Added V_{REF} (V) — Added footnote 4.
			Updated sysIO Single-Ended DC Electrical Characteristics section. Added I/O standards.
		Ordering Information	Updated MachXO3L Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added LCMXO3L-9400C part numbers.
			Updated MachXO3LF Ultra Low Power Commercial and Industrial Grade Devices, Halogen Free (RoHS) Packaging section. Added LCMXO3L-9400C part numbers.
