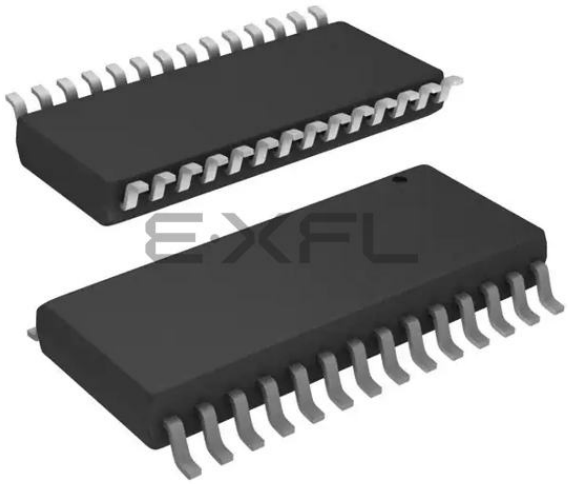
Microchip Technology - DSPIC33FJ06GS102AT-I/SO Datasheet



Welcome to E-XFL.COM

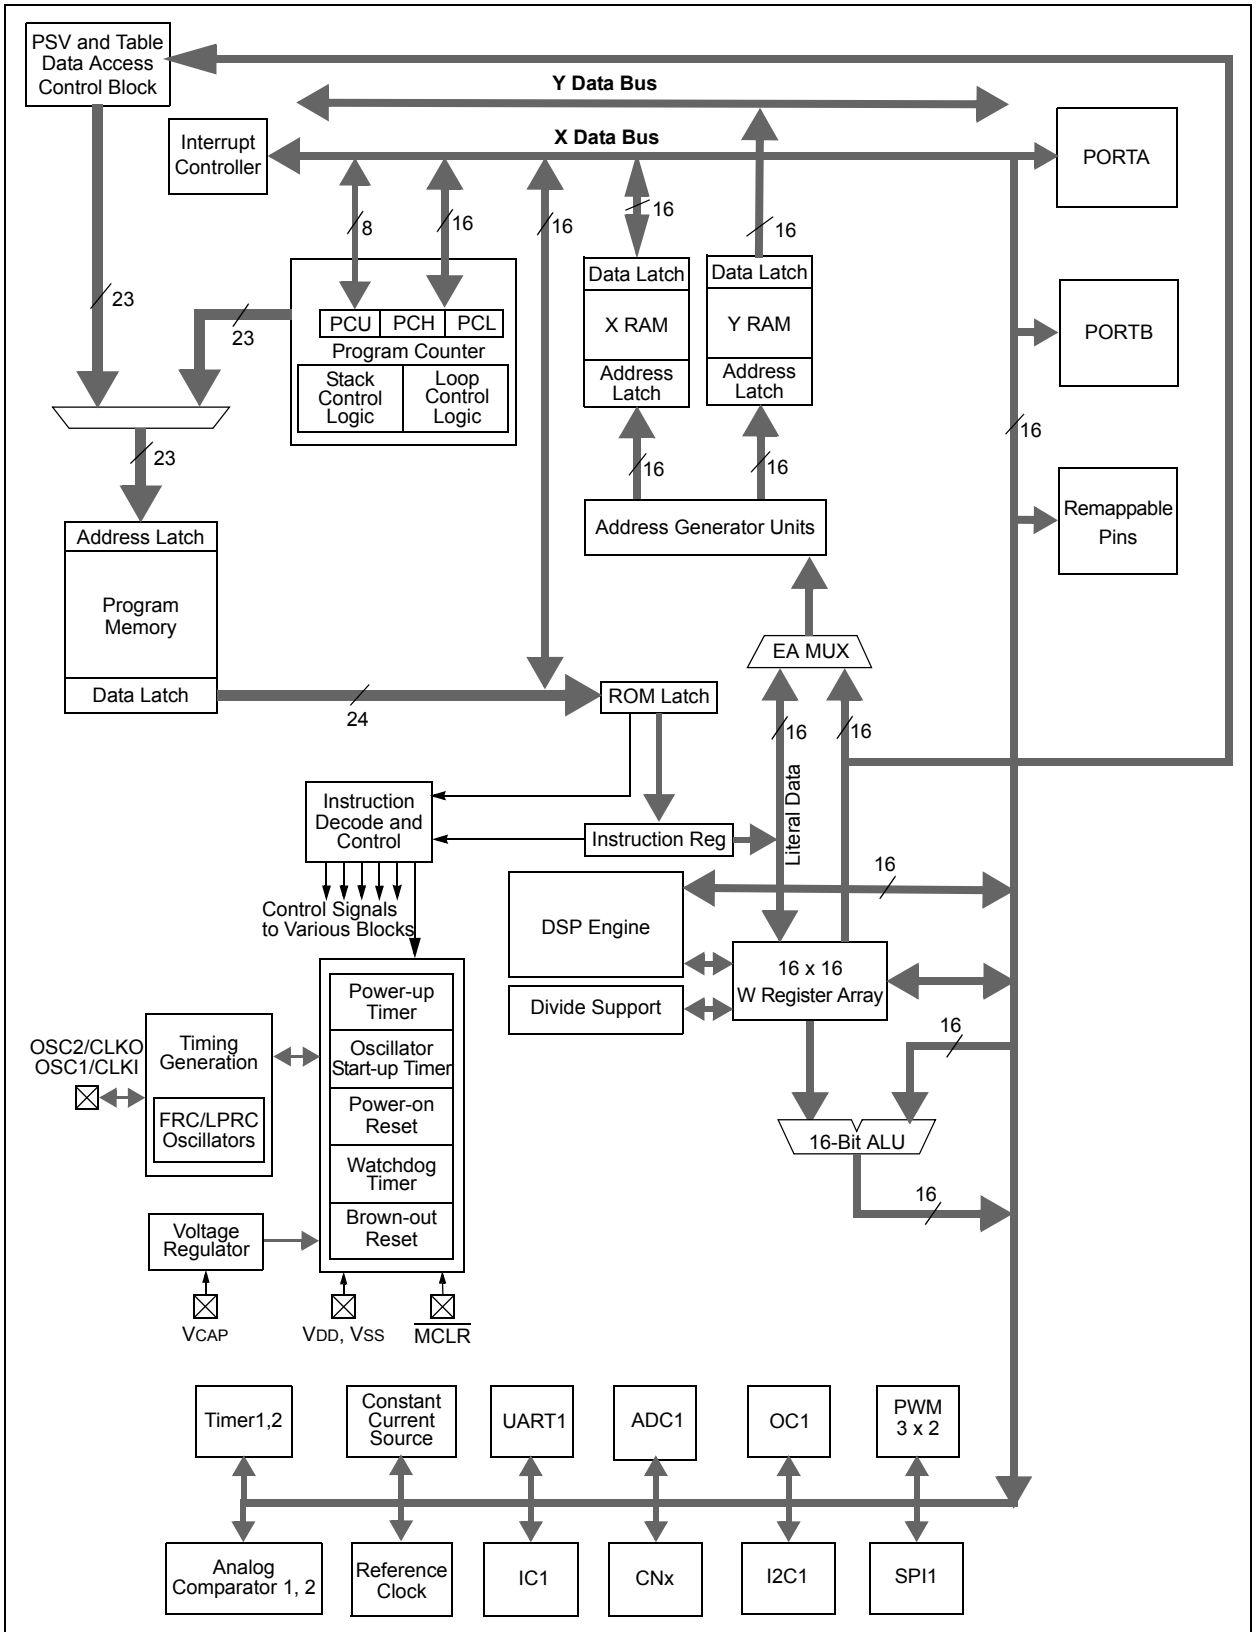
What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	40 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	21
Program Memory Size	6KB (2K x 24)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 6x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj06gs102at-i-so

FIGURE 1-1: dsPIC33FJ06GS001/101A/102A/202A and dsPIC33FJ09GS302 BLOCK DIAGRAM



Note: Not all pins or features are implemented on all device pinout configurations. See pinout diagrams for the specific pins and features present on each device.

3.0 CPU

Note 1: This data sheet summarizes the features of the dsPIC33FJ06GS001/101A/102A/202A and dsPIC33FJ09GS302 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 2. "CPU"** (DS70204) in the "*dsPIC33F/PIC24H Family Reference Manual*", which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The CPU module has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for DSP. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space. The actual amount of program memory implemented varies from device to device. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double-word move (`MOV.D`) instruction and the table instructions. Overhead-free program loop constructs are supported using the `DO` and `REPEAT` instructions, both of which are interruptible at any point.

The dsPIC33FJ06GS001/101A/102A/202A and dsPIC33FJ09GS302 devices have sixteen, 16-bit working registers in the programmer's model. Each of the working registers can serve as a Data, Address or Address Offset register. The sixteenth working register (W15) operates as a software Stack Pointer (SP) for interrupts and calls.

There are two classes of instruction: MCU and DSP. These two instruction classes are seamlessly integrated into a single CPU. The instruction set includes many addressing modes and is designed for optimum C compiler efficiency. For most instructions, the devices are capable of executing a data (or program data) memory read, a working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing A + B = C operations to be executed in a single cycle.

A block diagram of the CPU is shown in Figure 3-1, and the programmer's model is shown in Figure 3-2.

3.1 Data Addressing Overview

The data space can be addressed as 32K words or 64 Kbytes and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear data space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y data space boundary is device-specific.

Overhead-free circular buffers (Modulo Addressing mode) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. Furthermore, the X AGU Circular Addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data reordering for radix-2 FFT algorithms.

The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K program word boundary defined by the 8-bit Program Space Visibility Page (PSVPAG) register. The program-to-data space mapping feature lets any instruction access program space as if it were data space.

3.2 DSP Engine Overview

The DSP engine features a high-speed, 17-bit by 17-bit multiplier, a 40-bit ALU, two 40-bit saturating accumulators and a 40-bit bidirectional barrel shifter. The barrel shifter is capable of shifting a 40-bit value up to 16 bits, right or left, in a single cycle. The DSP instructions operate seamlessly with all other instructions and have been designed for optimal real-time performance. The `MAC` instruction and other associated instructions can concurrently fetch two data operands from memory while multiplying two W registers and accumulating and optionally saturating the result in the same cycle. This instruction functionality requires that the RAM data space be split for these instructions and linear for all others. Data space partitioning is achieved in a transparent and flexible manner through dedicating certain working registers to each address space.

8.0 OSCILLATOR CONFIGURATION

Note 1: This data sheet summarizes the features of the dsPIC33FJ06GS001/101A/102A/202A and dsPIC33FJ09GS302 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 42. "Oscillator (Part IV)"** (DS70307) in the *"dsPIC33F/PIC24H Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

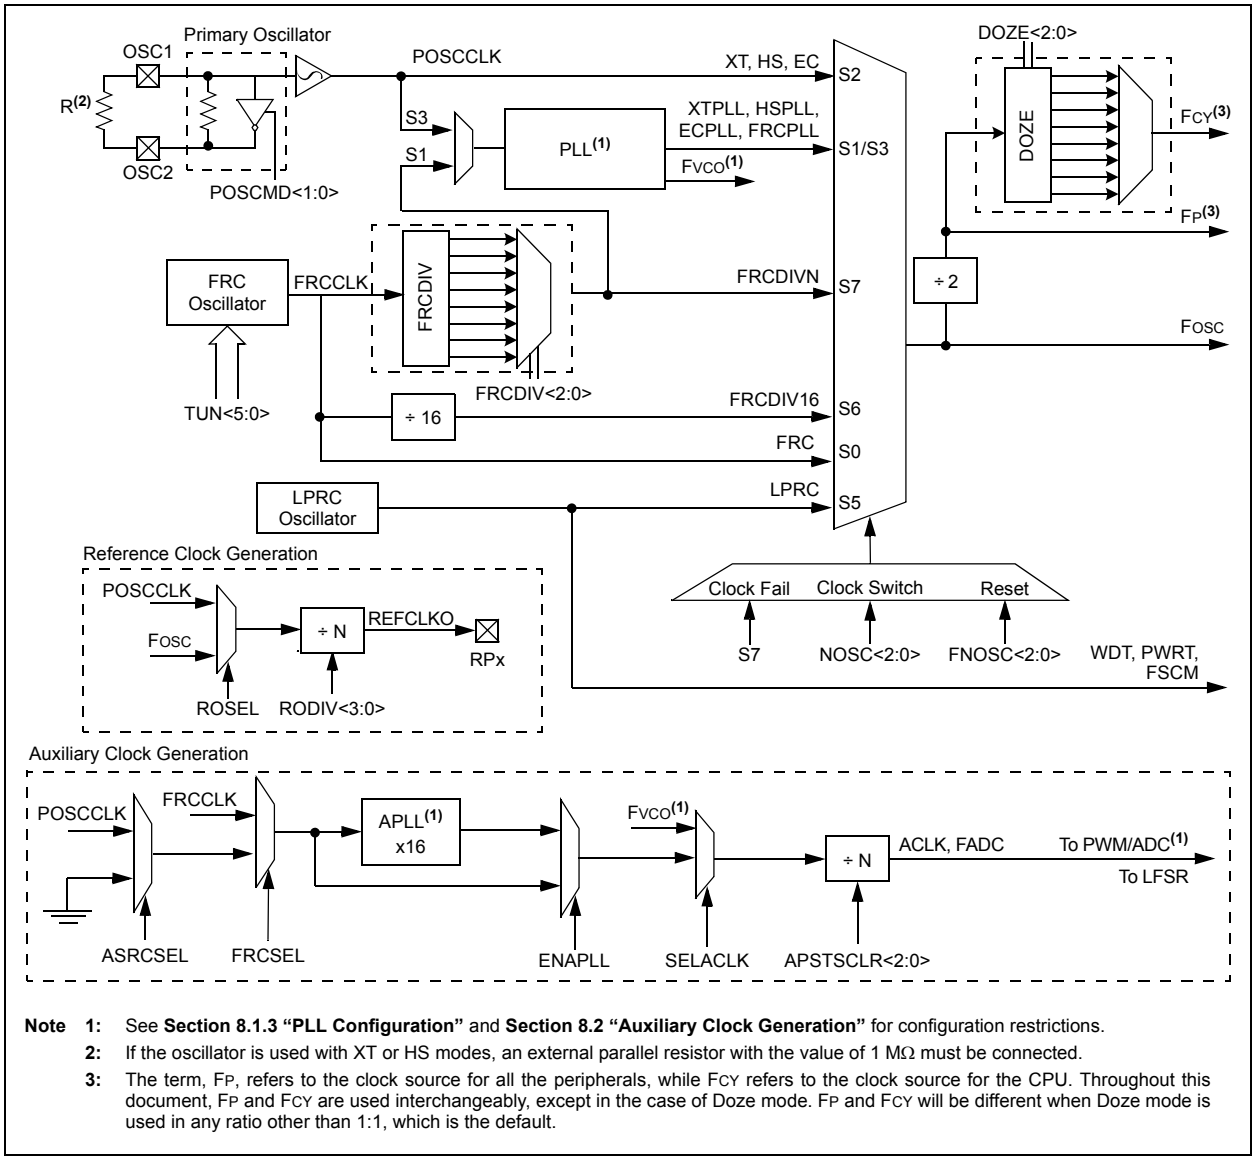
2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The oscillator system provides:

- External and internal oscillator options as clock sources
- An on-chip Phase Lock Loop (PLL) to scale the internal operating frequency to the required system clock frequency
- An internal FRC oscillator that can also be used with the PLL, thereby allowing full-speed operation without any external clock generation hardware
- Clock switching between various clock sources
- Programmable clock postscaler for system power savings
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and takes fail-safe measures
- An Oscillator Control register (OSCCON)
- Nonvolatile Configuration bits for main oscillator selection
- An auxiliary PLL for ADC and PWM

A simplified diagram of the oscillator system is shown in Figure 8-1.

FIGURE 8-1: OSCILLATOR SYSTEM DIAGRAM



Note 1: See **Section 8.1.3 "PLL Configuration"** and **Section 8.2 "Auxiliary Clock Generation"** for configuration restrictions.

2: If the oscillator is used with XT or HS modes, an external parallel resistor with the value of 1 MΩ must be connected.

3: The term, FP, refers to the clock source for all the peripherals, while FCY refers to the clock source for the CPU. Throughout this document, FP and FCY are used interchangeably, except in the case of Doze mode. FP and FCY will be different when Doze mode is used in any ratio other than 1:1, which is the default.

Note 1: This bit is not implemented in dsPIC33FJ06GS102A/202A devices.
2: This bit is not implemented in dsPIC33FJ06GS001/101A devices.

11.0 TIMER1

Note 1: This data sheet summarizes the features of the dsPIC33FJ06GS001/101A/102A/202A and dsPIC33FJ09GS302 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 11. "Timers"** (DS70205) in the *"dsPIC33F/PIC24H Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer, which can serve as a time counter for the Real-Time Clock (RTC) or operate as a free-running interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be operated from the low-power 32 kHz crystal oscillator available on the device
- Can be operated in Asynchronous Counter mode from an external clock source
- The Timer1 External Clock Input (T1CK) can optionally be synchronized to the internal device clock and the clock synchronization is performed after the prescaler

The unique features of Timer1 allow it to be used for Real-Time Clock applications. A block diagram of Timer1 is shown in Figure 11-1.

The Timer1 module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (FCY). In Synchronous and Asynchronous Counter modes, the input clock is derived from the external clock input at the T1CK pin.

The Timer1 modes are determined by the following bits:

- Timer1 Clock Source Control bit: TCS (T1CON<1>)
- Timer1 Synchronization Control bit: TSYNC (T1CON<2>)
- Timer1 Gate Control bit: TGATE (T1CON<6>)

The Timer1 control bit settings for different operating modes are given in the Table 11-1.

TABLE 11-1: TIMER1 MODE SETTINGS

Mode	TCS	TGATE	TSYNC
Timer1	0	0	x
Gated Timer1	0	1	x
Synchronous Counter	1	x	1
Asynchronous Counter	1	x	0

bit 15 **UARTEN:** UART1 Enable bit(1,3)
- 1 = UART1 is enabled; all UART1 pins are controlled by UART1, as defined by UEN<1:0>
- 0 = UART1 is disabled; all UART1 pins are controlled by port latches; UART1 power consumption is minimal

bit 14 **Unimplemented:** Read as '0'

bit 13 **USIDL:** Stop in Idle Mode bit(3)
- 1 = Discontinues module operation when device enters Idle mode
- 0 = Continues module operation in Idle mode

bit 12 **IREN:** IrDA® Encoder and Decoder Enable bit(2,3)
- 1 = IrDA® encoder and decoder are enabled
- 0 = IrDA® encoder and decoder are disabled

bit 11 **RTSMD:** Mode Selection for $\overline{\text{U1RTS}}$ Pin bit(3)
- 1 = $\overline{\text{U1RTS}}$ pin is in Simplex mode
- 0 = $\overline{\text{U1RTS}}$ pin is in Flow Control mode

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **UEN<1:0>:** UART1 Pin Enable bits(3)
- 11 = U1TX, U1RX and BCLK pins are enabled and used; $\overline{\text{U1CTS}}$ pin is controlled by port latches
- 10 = U1TX, U1RX, $\overline{\text{U1CTS}}$ and $\overline{\text{U1RTS}}$ pins are enabled and used
- 01 = U1TX, U1RX and $\overline{\text{U1RTS}}$ pins are enabled and used; $\overline{\text{U1CTS}}$ pin is controlled by port latches
- 00 = U1TX and U1RX pins are enabled and used; $\overline{\text{U1CTS}}$ and $\overline{\text{U1RTS}}$/BCLK pins are controlled by port latches

bit 7 **WAKE:** Wake-up on Start bit Detect During Sleep Mode Enable bit(3)
- 1 = UART1 will continue to sample the U1RX pin; interrupt is generated on falling edge; bit is cleared in hardware on following rising edge
- 0 = No wake-up is enabled

bit 6 **LPBACK:** UART1 Loopback Mode Select bit(3)
- 1 = Enable Loopback mode
- 0 = Loopback mode is disabled

bit 5 **ABAUD:** Auto-Baud Enable bit(3)
- 1 = Enable baud rate measurement on the next character – requires reception of a Sync field (0x55) before other data; cleared in hardware upon completion
- 0 = Baud rate measurement is disabled or completed

Note 1: Refer to **Section 17. "UART"** (DS70188) in the *"dsPIC33F/PIC24H Family Reference Manual"* for information on enabling the UART module for receive or transmit operation.

2: This feature is only available for the 16x BRG mode (BRGH = 0).

3: This bit is not available in the dsPIC33FJ06GS001 device.

19.0 HIGH-SPEED 10-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33FJ06GS001/101A/102A/202A and dsPIC33FJ09GS302 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 44. "High-Speed 10-Bit ADC"** (DS70321) in the *"dsPIC33F/PIC24H Family Reference Manual"*, which is available on the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33FJ06GS001/101A/102A/202A and dsPIC33FJ09GS302 family of devices provides high-speed successive approximation, Analog-to-Digital conversions to support applications such as AC-to-DC and DC-to-DC Power Converters.

19.1 Features Overview

The ADC module comprises the following features:

- 10-bit resolution
- Unipolar inputs
- One Successive Approximation Register (SAR)
- Up to eight external input channels
- Up to two internal analog inputs
- Dedicated result register for each analog input
- ±1 LSB accuracy at 3.3V
- Single supply operation
- 2 Msps conversion rate at 3.3V
- Low-power CMOS technology

19.2 Module Description

This ADC module is designed for applications that require low latency between the request for conversion and the resultant output data. Typical applications include:

- AC/DC Power Supplies
- DC/DC Converters
- Power Factor Correction (PFC)

This ADC works with the high-speed PWM module in power control applications that require high-frequency control loops. This small conversion delay reduces the "phase lag" between measurement and control system response.

Up to three inputs may be sampled at a time (two inputs from the dedicated Sample-and-Hold circuits and one from the shared Sample-and-Hold circuit). If multiple inputs request conversion, the ADC will convert them in a sequential manner, starting with the lowest order input.

This ADC design provides each pair of analog inputs (AN1, AN0), (AN3, AN2),..., the ability to specify its own trigger source out of a maximum of sixteen different trigger sources. This capability allows this ADC to sample and convert analog inputs that are associated with PWM generators operating on independent time bases.

The user application typically requires synchronization between analog data sampling and PWM output to the application circuit. The very high-speed operation of this ADC module allows "data on demand".

In addition, several hardware features have been added to the peripheral interface to improve real-time performance in a typical DSP-based application:

- Result alignment options
- Automated sampling
- External conversion start control
- Two internal inputs to monitor INTREF and EXTREF input signals (not available in dsPIC33FJ06GS101A/102A devices)

Block diagrams of the ADC module are shown in Figure 19-1 through Figure 19-5.

19.3 Module Functionality

The high-speed, 10-bit ADC module is designed to support power conversion applications when used with the high-speed PWM module. The ADC has one SAR and only one conversion can be processed at a time, yielding a conversion rate of 2 Msps or the equivalent of one 10-bit conversion, in half a microsecond (0.5 µs).

The ADC module supports up to eight external analog inputs and two internal analog inputs. To monitor reference voltage, two internal inputs, AN12 and AN13, are connected to the EXTREF and INTREF voltages, respectively.

Note: The dsPIC33FJ06GS101A/102A devices do not have the internal connection to EXTREF.

The analog reference voltage is defined as the device supply voltage (AV_{DD}/AV_{SS}).

REGISTER 20-1: CMPCONx: COMPARATOR CONTROL x REGISTER

R/W-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
CMPON(1)	—	CMPSIDL(1)	HYSSEL<1:0>(1)		FLTREN(1)	FCLKSEL(1)	DACOE(1)
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
INSEL<1:0>(1)		EXTREF(1)	HYSPOL(1)	CMPSTAT(1)	HGAIN(1)	CMPPOL(1)	RANGE(1)
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **CMPON:** Comparator Operating Mode bit(1)
1 = Comparator module is enabled
0 = Comparator module is disabled (reduces power consumption)

bit 14 **Unimplemented:** Read as '0'

bit 13 **CMPSIDL:** Stop in Idle Mode bit(1)
1 = Discontinues module operation when device enters Idle mode.
0 = Continues module operation in Idle mode
If a device has multiple comparators, any CMPSIDL bit that is set to '1' disables *all* comparators while in Idle mode.

bit 12-11 **HYSSEL<1:0>:** Comparator Hysteresis Select bits(1)
11 = 45 mV hysteresis
10 = 30 mV hysteresis
01 = 15 mV hysteresis
00 = No hysteresis is selected

bit 10 **FLTREN:** Digital Filter Enable bit(1)
1 = Digital filter is enabled
0 = Digital filter is disabled

bit 9 **FCLKSEL:** Digital Filter and Pulse Stretcher Clock Select bit(1)
1 = Digital filter and pulse stretcher operate with the PWM clock
0 = Digital filter and pulse stretcher operate with the system clock

bit 8 **DACOE:** DAC Output Enable(1)
1 = DAC analog voltage is output to DACOUT pin(2)
0 = DAC analog voltage is not connected to DACOUT pin

bit 7-6 **INSEL<1:0>:** Input Source Select for Comparator bits(1)
11 = Select CMPxD input pin
10 = Select CMPxC input pin
01 = Select CMPxB input pin
00 = Select CMPxA input pin

Note 1: This bit is not implemented in dsPIC33FJ06GS101A/102A devices.

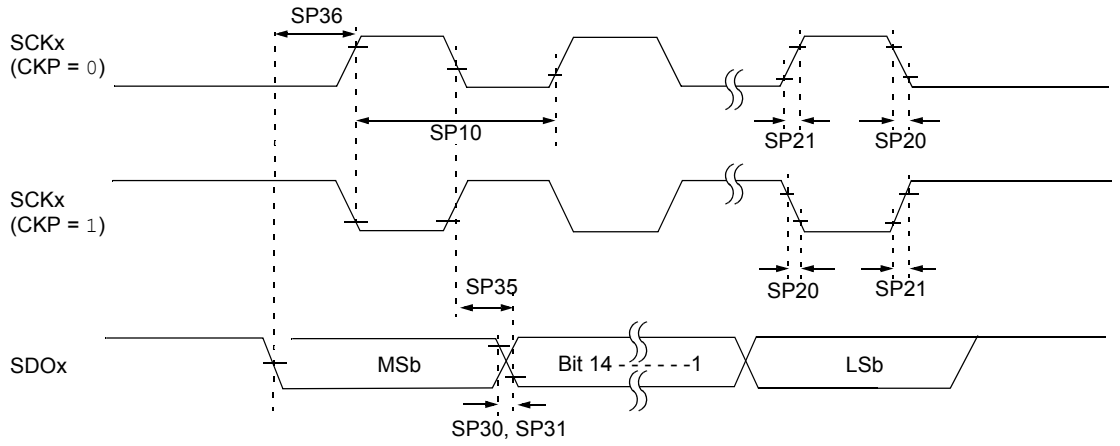
2: DACOUT can be associated only with a single comparator at any given time. The software must ensure that multiple comparators do not enable the DAC output by setting their respective DACOE bit.

3: For the INTREF value, refer to the DAC Module Specifications (Table 25-42) in **Section 25.0 "Electrical Characteristics"**.

TABLE 22-3: dsPIC33F CONFIGURATION BITS DESCRIPTION (CONTINUED)

Bit Field	Description
PLLKEN	PLL Lock Enable bit 1 = Clock switch to PLL source will wait until the PLL lock signal is valid 0 = Clock switch will not wait for the PLL lock signal
JTAGEN	JTAG Enable bit 1 = JTAG is enabled 0 = JTAG is disabled
ICS<1:0>	ICD Communication Channel Select bits 11 = Communicate on PGEC1 and PGED1 10 = Communicate on PGEC2 and PGED2 01 = Communicate on PGEC3 and PGED3 00 = Reserved, do not use

FIGURE 25-12: SPIx MASTER MODE (HALF-DUPLEX, TRANSMIT ONLY, CKE = 1) TIMING CHARACTERISTICS



Note: Refer to Figure 25-1 for load conditions.

TABLE 25-30: SPIx MASTER MODE (HALF-DUPLEX, TRANSMIT ONLY) TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	**Symbol**	**Characteristic(1)**	**Min**	**Typ(2)**	**Max**	**Units**	**Conditions**
SP10	TscP	Maximum SCKx Frequency	—	—	15	MHz	See **Note 3**
SP20	TscF	SCKx Output Fall Time	—	—	—	ns	See Parameter DO32 and **Note 4**
SP21	TscR	SCKx Output Rise Time	—	—	—	ns	See Parameter DO31 and **Note 4**
SP30	TdoF	SDOx Data Output Fall Time	—	—	—	ns	See Parameter DO32 and **Note 4**
SP31	TdoR	SDOx Data Output Rise Time	—	—	—	ns	See Parameter DO31 and **Note 4**
SP35	TscH2doV, TscL2doV	SDOx Data Output Valid after SCKx Edge	—	6	20	ns	
SP36	TdiV2scH, TdiV2scL	SDOx Data Output Setup to First SCKx Edge	30	—	—	ns	

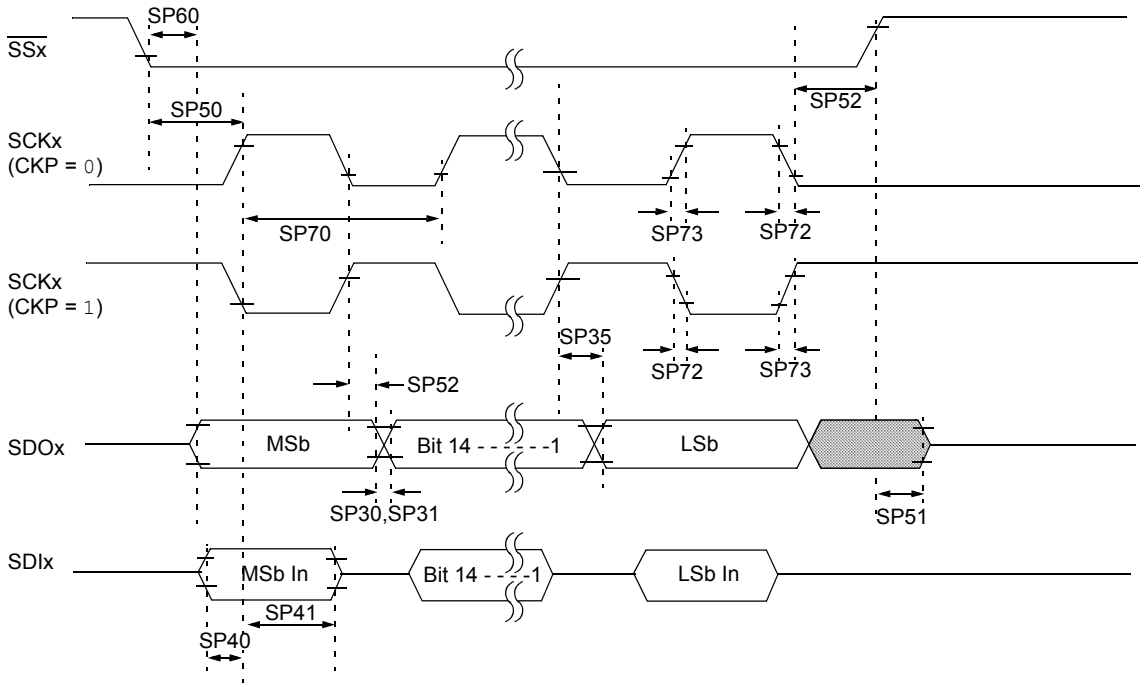
Note 1: These parameters are characterized, but are not tested in manufacturing.

2: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated.

3: The minimum clock period for SCKx is 66.7 ns. Therefore, the clock generated in master mode must not violate this specification.

4: Assumes 50 pF load on all SPIx pins.

FIGURE 25-16: SPIx SLAVE MODE (FULL-DUPLEX, CKE = 1, CKP = 1, SMP = 0) TIMING CHARACTERISTICS



Note: Refer to Figure 25-1 for load conditions.
