What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

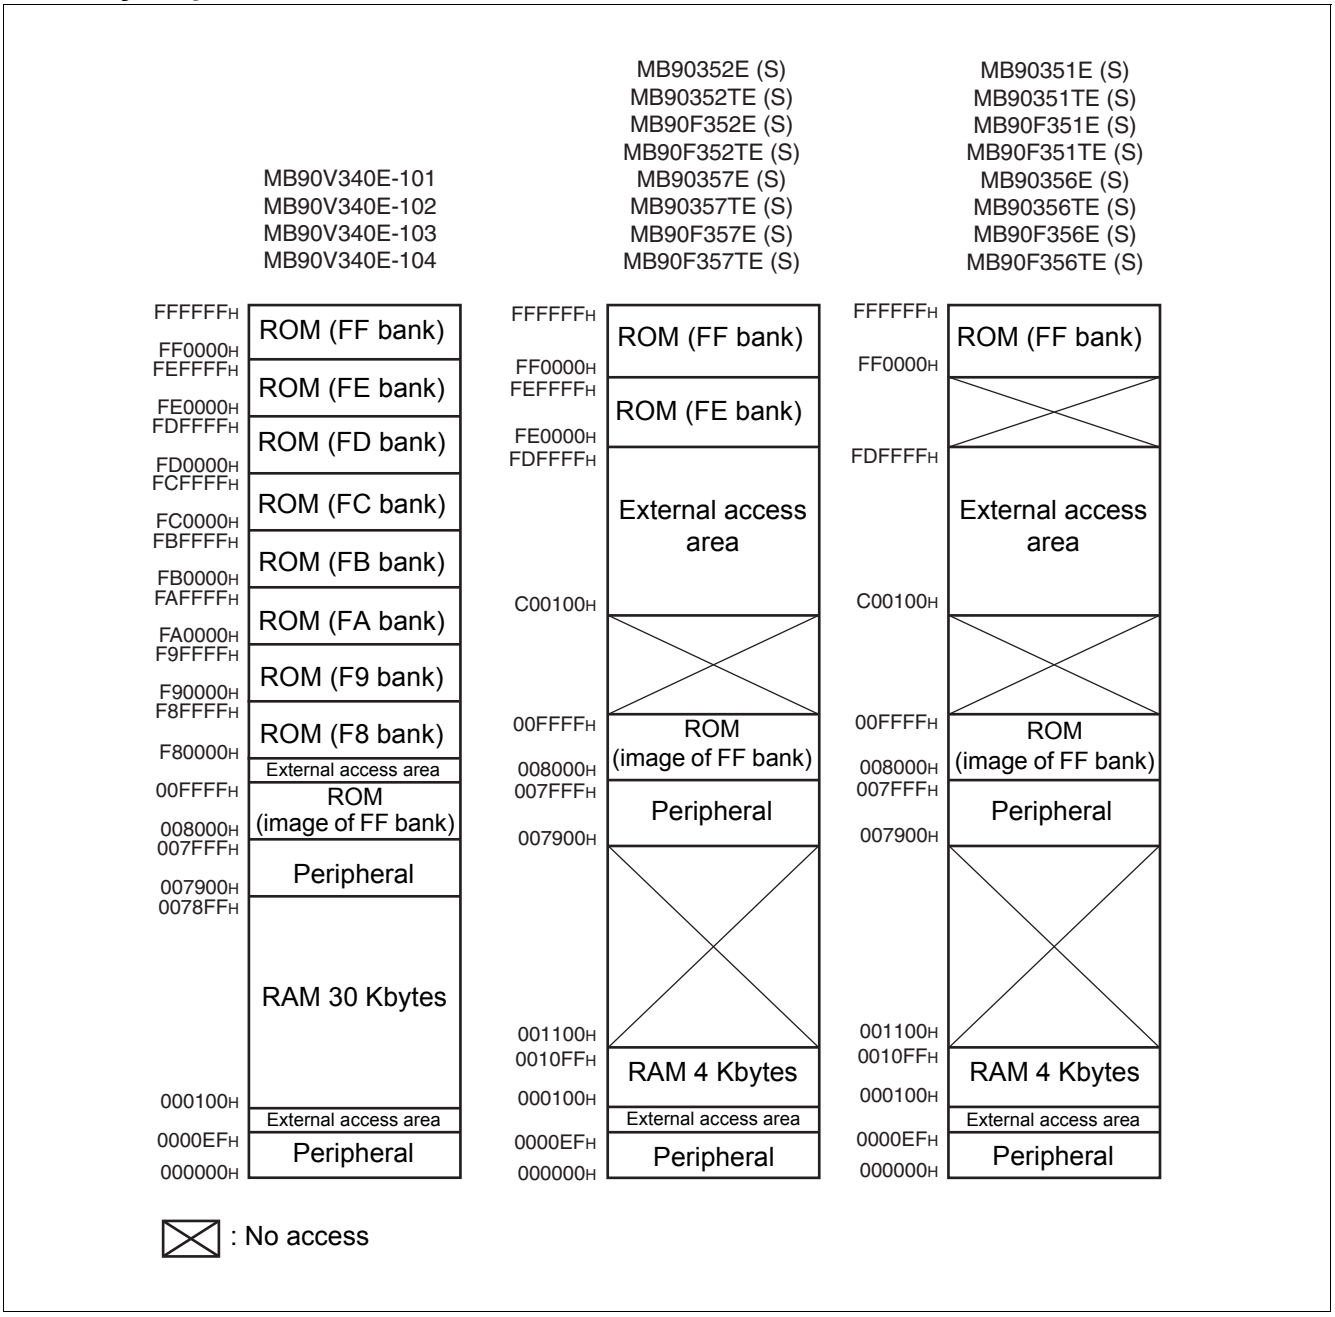
9. Memory Map



Note : The high-order portion of bank 00 gives the image of the FF bank ROM to make the small model of the C compiler effective. Since the low-order 16 bits are the same, the table in ROM can be referenced without using the far specification in the pointer declaration.
For example, an attempt to access $00C000_H$ practically accesses the value at $FFC000_H$ in ROM.
The ROM area in bank FF exceeds 32 Kbytes, and its entire image cannot be shown in bank 00.
The image between $FF8000_H$ and $FFFFFF_H$ is visible in bank 00, while the image between $FF0000_H$ and $FF7FFF_H$ is visible only in bank FF.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

*1 : R,C : Pull-up resistor and load capacitor of the SCL and SDA lines.

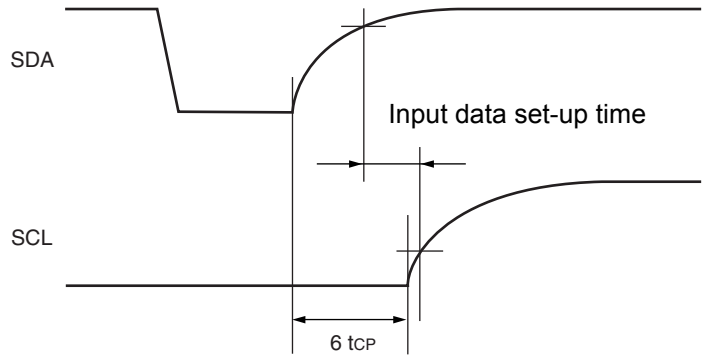
*2 : The maximum t_{HDDAT} has to meet at least that the device does not exceed the "L" width (t_{LOW}) of the SCL signal.

*3 : A Fast-mode I^2C -bus device can be used in a Standard-mode I^2C-bus system, but the requirement $t_{SUDAT} \geq 250$ ns must be met.

*4 : For use at over 100 kHz, set the machine clock to at least 6 MHz.

*5 : Refer to "• Note of SDA, SCL set-up time".

• Note of SDA, SCL set-up time



Note : The rating of the input data set-up time in the device connected to the bus cannot be satisfied depending on the load capacitance or pull-up resistor.
Be sure to adjust the pull-up resistor of SDA and SCL if the rating of the input data set-up time cannot be satisfied.
