What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Table 1.1 Outline of Specifications (2/9)

Classification	Module/Function	Description
Clock	Clock generation circuit	<ul style="list-style-type: none"> Main clock oscillator, sub clock oscillator, low-speed/high-speed on-chip oscillator, PLL frequency synthesizer, and IWDT-dedicated on-chip oscillator The peripheral module clocks can be set to frequencies above that of the system clock. Main-clock oscillation stoppage detection Separate frequency-division and multiplication settings for the system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD), flash-IF clock (FCLK) and external bus clock (BCLK) <p>The CPU and other bus masters run in synchronization with the system clock (ICLK): Up to 120 MHz Peripheral modules of MTU3, GPT, RSPI, SCIFA, USBA, ETHERC, EPTPC, EDMAC, and AES run in synchronization with PCLKA, which operates at up to 120 MHz. Other peripheral modules run in synchronization with PCLKB: Up to 60 MHz ADCLK in the SD12AD (unit 0) runs in synchronization with PCLKC: Up to 60 MHz ADCLK in the SD12AD (unit 1) runs in synchronization with PCLKD: Up to 60 MHz Flash IF run in synchronization with the flash-IF clock (FCLK): Up to 60 MHz Devices connected to the external bus run in synchronization with the external bus clock (BCLK): Up to 60 MHz</p> <ul style="list-style-type: none"> Multiplication is possible with using the high-speed on-chip oscillator (HOCO) as a reference clock of the PLL circuit
Reset		<p>Nine types of reset</p> <ul style="list-style-type: none"> RES# pin reset: Generated when the RES# pin is driven low. Power-on reset: Generated when the RES# pin is driven high and VCC = AVCC0 = AVCC1 rises. Voltage-monitoring 0 reset: Generated when VCC = AVCC0 = AVCC1 falls. Voltage-monitoring 1 reset: Generated when VCC = AVCC0 = AVCC1 falls. Voltage-monitoring 2 reset: Generated when VCC = AVCC0 = AVCC1 falls. Deep software standby reset: Generated in response to an interrupt to trigger release from deep software standby. Independent watchdog timer reset: Generated when the independent watchdog timer underflows, or a refresh error occurs. Watchdog timer reset: Generated when the watchdog timer underflows, or a refresh error occurs. Software reset: Generated by register setting.
Power-on reset		If the RES# pin is at the high level when power is supplied, an internal reset is generated. After VCC = AVCC0 = AVCC1 has exceeded the voltage detection level and the specified period has elapsed, the reset is cancelled.
Voltage detection circuit (LVDA)		<p>Monitors the voltage being input to the VCC = AVCC0 = AVCC1 pins and generates an internal reset or internal interrupt.</p> <ul style="list-style-type: none"> Voltage detection circuit 0 Capable of generating an internal reset The option-setting memory can be used to select enabling or disabling of the reset. Voltage detection level: Selectable from three different levels (2.94 V, 2.87 V, and 2.80 V) Voltage detection circuits 1 and 2 Voltage detection level: Selectable from three different levels (2.99 V, 2.92 V, and 2.85 V) Digital filtering (1/2, 1/4, 1/8, and 1/16 LOCO frequency) Capable of generating an internal reset Two types of timing are selectable for release from reset An internal interrupt can be requested. Detection of voltage rising above and falling below thresholds is selectable. Maskable or non-maskable interrupt is selectable Voltage detection monitoring Event linking
Low power consumption	Low power consumption facilities	<ul style="list-style-type: none"> Module stop function Four low power consumption modes Sleep mode, all-module clock stop mode, software standby mode, and deep software standby mode
	Battery backup function	<ul style="list-style-type: none"> When the voltage on the VCC pin drops, battery power from the VBATT pin is supplied to keep the real-time clock (RTC) operating.
