What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Cautions 1. The RL78 microcontrollers have an on-chip debug function, which is provided for development and evaluation. Do not use the on-chip debug function in products designated for mass production, because the guaranteed number of rewritable times of the flash memory may be exceeded when this function is used, and product reliability therefore cannot be guaranteed. Renesas Electronics is not liable for problems occurring when the on-chip debug function is used.

2. The pins mounted depend on the product. See 2.1 Port Function to 2.2.1 With functions for each product in the RL78/L13 User's Manual.

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

2.3 DC Characteristics

2.3.1 Pin characteristics

(T_A = –40 to +85°C, 1.6 V ≤ V_{DD} ≤ 5.5 V, V_{SS} = 0 V)

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
Output current, high[Note 1]	I_{OH1}	Per pin for P00 to P07, P10 to P17, P22 to P27, P30 to P35, P40 to P47, P50 to P57, P70 to P77, P125 to P127, P130	1.6 V ≤ V_{DD} ≤ 5.5 V			–10.0[Note 2]	mA
<R>		Total of P00 to P07, P10 to P17, P22 to P27, P30 to P35, P40 to P47, P50 to P57, P70 to P77, P125 to P127, P130 (When duty = 70%[Note 3])	4.0 V ≤ V_{DD} ≤ 5.5 V			–90.0	mA
			2.7 V ≤ V_{DD} < 4.0 V			–15.0	mA
			1.8 V ≤ V_{DD} < 2.7 V			–7.0	mA
			1.6 V ≤ V_{DD} < 1.8 V			–3.0	mA
	I_{OH2}	Per pin for P20 and P21	1.6 V ≤ V_{DD} ≤ 5.5 V			–0.1[Note 2]	mA
		Total of all pins (When duty = 70%[Note 3])	1.6 V ≤ V_{DD} ≤ 5.5 V			–0.2	mA

Notes 1. Value of the current at which the device operation is guaranteed even if the current flows from the V_{DD} pin to an output pin

2. Do not exceed the total current value.

3. Output current value under conditions where the duty factor ≤ 70%.
The output current value that has changed to the duty factor > 70% the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current of pins = (I_{OH} × 0.7)/(n × 0.01)

<Example> Where n = 80% and I_{OH} = –90.0 mA

Total output current of pins = (–90.0 × 0.7)/(80 × 0.01) ≅ –78.75 mA

However, the current that is allowed to flow into one pin does not vary depending on the duty factor. A current higher than the absolute maximum rating must not flow into one pin.

Caution P00, P04 to P07, P16, P17, P35, P42 to P44, P46, P47, P53 to P56, and P130 do not output high level in N-ch open-drain mode.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

Notes 1. Total current flowing into V_{DD}, including the input leakage current flowing when the level of the input pin is fixed to V_{DD} or V_{SS}. The values below the MAX. column include the peripheral operation current. However, not including the current flowing into the LCD controller/driver, A/D converter, LVD circuit, comparator, I/O port, on-chip pull-up/pull-down resistors, and the current flowing during data flash rewrite.

2. When high-speed on-chip oscillator and subsystem clock are stopped.

3. When high-speed system clock and subsystem clock are stopped.

4. When high-speed on-chip oscillator and high-speed system clock are stopped. When setting ultra-low power consumption oscillation (AMPHS1 = 1). The current flowing into the LCD controller/driver, 16-bit timer KB20, real-time clock 2, 12-bit interval timer, and watchdog timer is not included.

5. Relationship between operation voltage width, operation frequency of CPU and operation mode is as below.

HS (high-speed main) mode: 2.7 V ≤ V_{DD} ≤ 5.5 V@1 MHz to 24 MHz
2.4 V ≤ V_{DD} ≤ 5.5 V@1 MHz to 16 MHz
LS (low-speed main) mode: 1.8 V ≤ V_{DD} ≤ 5.5 V@1 MHz to 8 MHz
LV (low-voltage main) mode: 1.6 V ≤ V_{DD} ≤ 5.5 V@1 MHz to 4 MHz

Remarks 1. f_{MX}: High-speed system clock frequency (X1 clock oscillation frequency or external main system clock frequency)

2. f_{HOCO}: High-speed on-chip oscillator clock frequency (48 MHz max.)

3. f_{IH}: High-speed on-chip oscillator clock frequency (24 MHz max.)

4. f_{SUB}: Subsystem clock frequency (XT1 clock oscillation frequency)

5. Except subsystem clock operation, temperature condition of the TYP. value is T_A = 25°C

(5) Communication at different potential (1.8 V, 2.5 V, 3 V) (UART mode) (2/2)

Absolute Maximum Ratings (2/3)

Parameter	Symbol	Conditions		Ratings	Unit
LCD voltage	V_{L1}	V_{L1} voltage[Note 1]		–0.3 to +2.8 and –0.3 to V_{L4} +0.3	V
	V_{L2}	V_{L2} voltage[Note 1]		–0.3 to V_{L4} +0.3[Note 2]	V
	V_{L3}	V_{L3} voltage[Note 1]		–0.3 to V_{L4} +0.3[Note 2]	V
	V_{L4}	V_{L4} voltage[Note 1]		–0.3 to +6.5	V
	V_{LCAP}	CAPL, CAPH voltage[Note 1]		–0.3 to V_{L4} +0.3[Note 2]	V
	V_{OUT}	COM0 to COM7 SEG0 to SEG50 output voltage	External resistance division method	–0.3 to V_{DD} +0.3[Note 2]	V
			Capacitor split method	–0.3 to V_{DD} +0.3[Note 2]	V
			Internal voltage boosting method	–0.3 to V_{L4} +0.3[Note 2]	V

Notes 1. This value only indicates the absolute maximum ratings when applying voltage to the V_{L1}, V_{L2}, V_{L3}, and V_{L4} pins; it does not mean that applying voltage to these pins is recommended. When using the internal voltage boosting method or capacitance split method, connect these pins to V_{SS} via a capacitor (0.47 μF ± 30%) and connect a capacitor (0.47 μF ± 30%) between the CAPL and CAPH pins.

2. Must be 6.5 V or lower.

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Remark V_{SS}: Reference voltage

3.3 DC Characteristics

3.3.1 Pin characteristics

(T_A = –40 to +105°C, 2.4 V ≤ V_{DD} ≤ 5.5 V, V_{SS} = 0 V)

<R>

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
Output current, high[Note 1]	I_{OH1}	Per pin for P00 to P07, P10 to P17, P22 to P27, P30 to P35, P40 to P47, P50 to P57, P70 to P77, P125 to P127, P130	2.4 V ≤ V_{DD} ≤ 5.5 V			–3.0[Note 2]	mA
		Total of P00 to P07, P10 to P17, P22 to P27, P30 to P35, P40 to P47, P50 to P57, P70 to P77, P125 to P127, P130 (When duty = 70%[Note 3])	4.0 V ≤ V_{DD} ≤ 5.5 V			–45.0	mA
			2.7 V ≤ V_{DD} < 4.0 V			–15.0	mA
			2.4 V ≤ V_{DD} < 2.7 V			–7.0	mA
	I_{OH2}	Per pin for P20 and P21	2.4 V ≤ V_{DD} ≤ 5.5 V			–0.1[Note 2]	mA
		Total of all pins (When duty = 70%[Note 3])	2.4 V ≤ V_{DD} ≤ 5.5 V			–0.2	mA

Notes 1. Value of the current at which the device operation is guaranteed even if the current flows from the V_{DD} pin to an output pin

2. Do not exceed the total current value.

3. Output current value under conditions where the duty factor ≤ 70%.
The output current value that has changed to the duty factor > 70% the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

- Total output current of pins = (I_{OH} × 0.7)/(n × 0.01)

<Example> Where n = 80% and I_{OH} = –45.0 mA
Total output current of pins = (–45.0 × 0.7)/(80 × 0.01) = –39.375 mA

However, the current that is allowed to flow into one pin does not vary depending on the duty factor. A current higher than the absolute maximum rating must not flow into one pin.

Caution P00, P04 to P07, P16, P17, P35, P42 to P44, P46, P47, P53 to P56, and P130 do not output high level in N-ch open-drain mode.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

Notes 1. Total current flowing into V_{DD}, including the input leakage current flowing when the level of the input pin is fixed to V_{DD} or V_{SS}. The values below the MAX. column include the peripheral operation current. However, not including the current flowing into the LCD controller/driver, A/D converter, LVD circuit, comparator, I/O port, on-chip pull-up/pull-down resistors, and the current flowing during data flash rewrite.

2. When high-speed on-chip oscillator and subsystem clock are stopped.

3. When high-speed system clock and subsystem clock are stopped.

4. When high-speed on-chip oscillator and high-speed system clock are stopped. When setting ultra-low power consumption oscillation (AMPHS1 = 1). The current flowing into the LCD controller/driver, 16-bit timer KB20, real-time clock 2, 12-bit interval timer, and watchdog timer is not included.

5. Relationship between operation voltage width, operation frequency of CPU and operation mode is as below.

HS (high-speed main) mode: 2.7 V ≤ V_{DD} ≤ 5.5 V@1 MHz to 24 MHz

2.4 V ≤ V_{DD} ≤ 5.5 V@1 MHz to 16 MHz

2. f_{HOCO}: High-speed on-chip oscillator clock frequency (48 MHz max.)

3. f_{IH}: High-speed on-chip oscillator clock frequency (24 MHz max.)

4. f_{SUB}: Subsystem clock frequency (XT1 clock oscillation frequency)

5. Except subsystem clock operation, temperature condition of the TYP. value is T_A = 25°C
