### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

|                                |   |
|--------------------------------|---|
| Product Status                 | Obsolete  |
| Number of LABs/CLBs            | 28750   |
| Number of Logic Elements/Cells | 115000  |
| Total RAM Bits                 | 7987200   |
| Number of I/O                  | 660   |
| Number of Gates                | -   |
| Voltage - Supply               | 0.95V ~ 1.26V   |
| Mounting Type                  | Surface Mount   |
| Operating Temperature          | 0°C ~ 85°C (TJ)   |
| Package / Case                 | 1152-BBGA, FCBGA  |
| Supplier Device Package        | 1152-FCBGA (35x35)  |
| Purchase URL                   | <a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga115e-5ff1152c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga115e-5ff1152c</a> |

## Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM and ROM. Table 2-2 lists the modes and the capability of the Slice blocks.

**Table 2-2. Slice Modes**

|           | Logic              | Ripple                | RAM                  | ROM      |
|-----------|--------------------|-----------------------|----------------------|----------|
| PFU Slice | LUT 4x2 or LUT 5x1 | 2-bit Arithmetic Unit | SPR 16x2<br>DPR 16x2 | ROM 16x2 |

### Logic Mode

In this mode, the LUTs in each Slice are configured as combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other Slices in the PFU.

### Ripple Mode

Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Up counter 2-bit
- Down counter 2-bit
- Comparator functions of A and B inputs
  - A greater-than-or-equal-to B
  - A not-equal-to B
  - A less-than-or-equal-to B

Ripple Mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per slice basis to allow fast arithmetic functions to be constructed by concatenating Slices.

### RAM Mode

In this mode, distributed RAM can be constructed using each LUT block as a 16x1-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the Slice. Table 2-3 shows the number of Slices required to implement different distributed RAM primitives. Dual port memories involve the pairing of two Slices, one Slice functions as the read-write port. The other companion Slice supports the read-only port. For more information on RAM mode, please see details of additional technical documentation at the end of this data sheet.

**Table 2-3. Number of Slices Required For Implementing Distributed RAM**

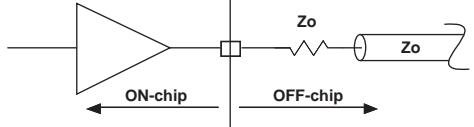

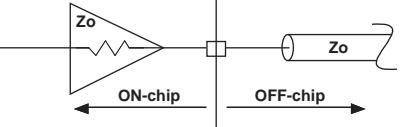

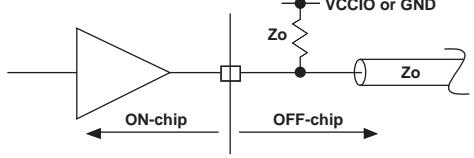

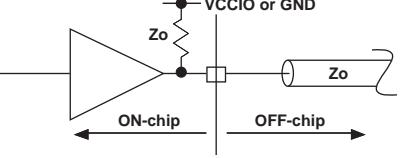

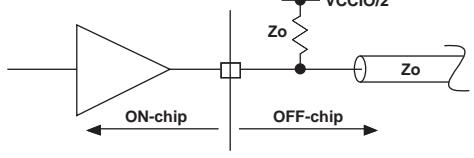

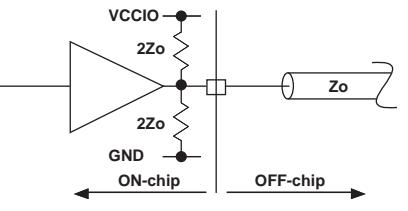

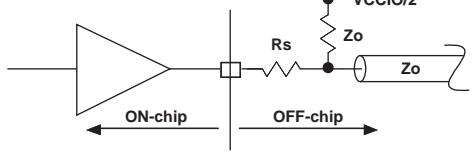

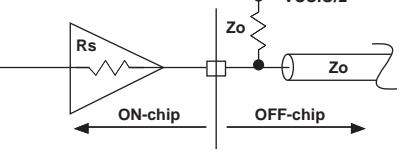

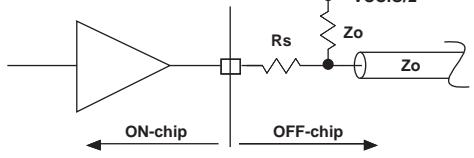

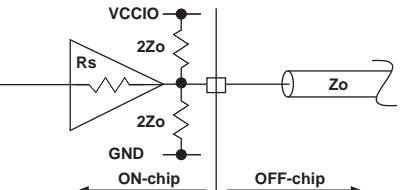

|                  | SPR16x2 | DPR16x2 |
|------------------|---------|---------|
| Number of Slices | 1       | 2       |

Note: SPR = Single Port RAM, DPR = Dual Port RAM

### ROM Mode

The ROM mode uses the same principal as the RAM modes, but without the Write port. Pre-loading is accomplished through the programming interface during configuration.

**Figure 2-27. Output Termination Schemes**

| Termination Type  | Discrete Off-Chip Solution  | Lattice On-Chip Solution  |
|---|---|---|
| Series termination (controlled output impedance)  |    |    |
| Parallel termination to V <sub>CCIO</sub> or parallel driving end   |    |    |
| Parallel termination to V <sub>CCIO</sub> /2 driving end  |    |    |
| Combined series + parallel termination to V <sub>CCIO</sub> /2 at driving end (only series termination moved on-chip) |   |   |
| Combined series + parallel to V <sub>CCIO</sub> /2 driving end  |  |  |

**PURESPEED I/O Single-Ended DC Electrical Characteristics**

Over Recommended Operating Conditions

| Input/Output Standard                       | V <sub>IL</sub> |              | V <sub>IH</sub> |          | V <sub>OL Max.</sub> (V) | V <sub>OH Min.</sub> (V) | I <sub>OL</sub> (mA) | I <sub>OH</sub> (mA) |
|---|-----------------|--------------|-----------------|----------|--------------------------|--------------------------|----------------------|----------------------|

1. Input only.

2. Input with on-chip series termination.

**Signal Descriptions (Cont.)**

| Signal Name  | I/O | Description  |
|--|-----|--|
| RESETN   |     | Reset. (Also sent to general routing). During configuration it resets the configuration state machine. After configuration this pin can perform the global set/reset (GSR) functions or can be used as a general input pin.  |
| CFGIRQN  | O   | MPI Interrupt request active low signal is controlled by system bus interrupt controller and may be sourced from any bus error or MPI configuration error. It can be connected to one of MPC860 IRQ pins.  |
| TSALLN   | I   | Tristates all I/O.   |
| <b>Configuration Pads (User I/O if not used. Used during sysCONFIG.)</b> |     |  |
| HDC/SI   | O   | <p>High During Configuration is output high until configuration is complete. It is used as a control output, indicating that configuration is not complete.</p> <p>For SPI modes, this pin is used to download the read command and initial read address into the Flash memory device on the falling edge of SCK. This pin will be connected to SI of the memory. If the SPI mode is used, the 8-bit instruction code 0x03 will be downloaded followed by a 24-bit starting address of 0x000000 or a non-zero stat address for partial reconfiguration. If the SPIX mode has been selected, the 8-bit instruction captured on D[7:0] at power-up will be shifted in and followed by a 32-bit starting address of 0x000000.</p> |
| LDCN/SCS   | O   | <p>Low During Configuration is output low until configuration is complete. It is used as a control output, indicating that configuration is not complete.</p> <p>For SPI modes, this is an active low chip select for Flash memories. It will go active after INITN goes high but before SCK begins. During power up LDCN will be low. Once INITN goes high, LDCN will go high for 100ns-200ns after which time it will go back low and configuration can begin. During the 100ns-200ns period, the read instruction will be latched for SPIX mode.</p>  |
| DOUT   | O   | Serial data output that can drive the D0/DIN of daisy-chained slave devices. The data-stream from this output will propagate preamble bits of the bitstream to daisy-chained devices. Data out on DOUT changes on the rising edge of CCLK.   |
| QOUT/CEON  | O   | <p>During daisy-chaining configuration, QOUT is the serial data output that can drive the D0/DIN of daisy-chained slave devices that do not propagate preamble bits. Data out on QOUT changes on the rising edge of CCLK.</p> <p>During parallel-chaining configuration, active low CEON enables the cascaded slave device to receive bitstream data.</p>  |
| RDN  | I   | Used in the asynchronous peripheral configuration mode. A low on RDN changes D[7:3] into status outputs. WRN and RDN should not be used simultaneously. If they are, the write strobe overrides.   |
| WRN  | I   | When the FPGA is selected, a low on the write strobe, WRN, loads the data on D[7:0] inputs into an internal data buffer.   |
| CS0N CS1   | I   | Used in the asynchronous peripheral, slave parallel and MPI modes. The FPGA is selected when CS0N is low and CS1 is high. During configuration, a pull-up is enabled on both except with MPI DMA access control.   |
| A[21:0]  | I/O | In master parallel mode, A[21:0] is an output and will address the configuration EPROMs up to 4 MB space. For MPI configuration mode, A[17:0] will be the MPI address MPI_ADDR[31:14], A[19:18] will be the transfer size and A[21:20] will be the burst mode and burst in process.  |

# LatticeSC/M Family Data Sheet

## Revision History

December 2011

Data Sheet DS1004

| Date          | Version | Section                          | Change Summary  |
|---------------|---------|----------------------------------|---|
| February 2006 | 01.0    | —                                | Initial release.  |
| March 2006    | 01.1    | Introduction                     | SC25 1020 I/O count changed to 476.   |
|               |         | Architecture                     | Changed ROM 16X4 to ROM 16X2.   |
|               |         |                                  | Changed "X2 or X4" to "DIV2 or DIV4".   |
|               |         |                                  | Added Global Set/Reset Section.   |
|               |         | DC and Switching Characteristics | Added notes 5 and 6 to Recommended Operating Conditions table.  |
|               |         |                                  | Added Power Supply Ramp Rates table.  |
|               |         |                                  | Removed -5 and -6 speed grades from Typical Building Block Performance table.   |
|               |         |                                  | Added Input Delay Timing table.   |
|               |         |                                  | Added Synchronous GSR Timing table.   |
|               |         | Pinout Information               | Expanded PROBE_VCC and PROBE_GND description.   |
|               |         |                                  | Removed A-RXREFCLKP_[L/R] from Signal Description table.  |
|               |         |                                  | Added RESP_[ULC/URC] to Signal Description table.   |
|               |         |                                  | Added notes 1 and 2 to Signal Description table.  |
|               |         |                                  | Changed number of NCs to 28.  |
|               |         |                                  | Changed number of SERDES (signal + power supply) to 74.   |
|               |         |                                  | Removed RESP balls from NC list (B2, C2, B29, C29).   |
|               |         |                                  | Added note to VTT table.  |
|               |         |                                  | Changed RxRefclk (B2 and C2) to NC.   |
|               |         |                                  | Added RESP_ULC.   |
|               |         |                                  | Added RESP_URC.   |
|               |         |                                  | Changed RxRefclk (B29 and C29) to NC.   |
| June 2006     | 01.2    | Introduction                     | Changed SERDES min bandwidth from 622 Mbps to 600 Mbps.   |
|               |         |                                  | Changed max SERDES bandwidth from 3.4 Gbps to 3.8 Gbps.   |
|               |         |                                  | Corrected number of package I/Os for the SC80 and SC115 1704 pin packages.  |
|               |         |                                  | Updated speed performance for typical functions with ispLEVER 6.0 values.   |
|               |         | Architecture                     | Changed "When these pins are not used they should be left unconnected." with "Unused VTT pins should be connected to GND if the internal or external VCMT function is not used in the bank. If the internal or external VCMT function for differential input termination is used, the VTT pins should be unconnected and allowed to float." |
|               |         |                                  | Added "SERDES Power Supply Sequencing Requirements" section.  |
|               |         |                                  | Changed total bandwidth per quad from 13.6 Gbps to 15.2 Gbps.   |
|               |         |                                  | Added the accuracy of the temperature-sensing diode to be typically +/- 10 °C. Also referred to a temperature-sensing diode application note for more information.  |
|               |         |                                  | Changed "CTAP" to "internal or external VCMT".  |
|               |         | DC and Switching Characteristics | Changed VCC12 parameter to include VDDP, VDDTX and VDDRX.   |
|               |         |                                  | Changed typical values to match ispLEVER 6.0 Power Calculator.  |

| Date                   | Version         | Section                                     | Change Summary  |
|------------------------|-----------------|---|---|
| August 2006<br>(cont.) | 01.3<br>(cont.) | DC and Switching Characteristics<br>(cont.) | Updated LatticeSC Family Timing Adders with ispLEVER 6.0 SP1 results  |
|                        |                 |   | Updated PLL Timing Parameters based on PDE testing results  |
|                        |                 |   | Removed RDDATA parameter from sysCONFIG readback timing table   |
|                        |                 | Multiple                                    | Changed TDO/RDDATA to TDO   |
|                        |                 | Pinout Information                          | Removed all MPI signals from SC15 256 pin package Dual Function Column  |
|                        |                 |   | Added note to SC15, SC25 900 pin package that the package supports a 16 bit MPI   |
|                        |                 |   | Added note that pin D3 in an SC15 and SC25 900 pin package should not be used for single-ended outputs  |
|                        |                 |   | Added note that pin D28 in an SC15 and SC25 900 pin package should not be used for single-ended outputs   |
|                        |                 |   | Added note to SC25 1020 pin package that the package supports a 16 bit MPI  |
|                        |                 |   | Added note to SC80 1152 pin package that the package supports a 32 bit MPI  |
|                        |                 |   | Added note to SC80 1704 pin package that the package supports a 32 bit MPI  |
|                        |                 | Ordering Information                        | Changed "fcBGA" for the 1020 packages to "ffBGA"  |
| November 2006          | 01.4            | Introduction                                | LatticeSC Family Selection Guide table – I/O count for SC80 device, 1704 fcBGA package changed to 904/32. I/O count for SC115 device, 1704 fcBGA package changed to 942/32. |
|                        |                 | DC and Switching Characteristics            | DC Electrical Characteristics table – Updated the initialization and standby supply current values.   |
|                        |                 |   | DC Electrical Characteristics table – Updated the sysCONFIG Master Parallel mode RCLK low and RCLK high time specifications.  |
|                        |                 |   | DC Electrical Characteristics table – Updated VCCIO values for LVPECL33 I/Os.   |
|                        |                 | Pin Information                             | Pin Information Summary table - Changed number of single ended user I/Os from 906 to 904 for 1704 fcBGA.  |
|                        |                 |   | Removed the single-ended only output restriction on pins D3 and D28 in an SC15 and SC25 900 pin package.  |
|                        |                 | Ordering Information                        | Ordering Information tables - Changed number of I/Os from 906 to 904 for 1704 fcBGA.  |
|                        |                 |   | Added ordering part numbers for LatticeSC/SCM 40K and 115K LUT devices.   |
|                        |                 |   | Added lead-free ordering part numbers.  |
|                        |                 | Multiple                                    | Changed number of available SC80 I/O from 906 to 904.   |
|                        |                 |   | Changed number of available SC115 I/O from 944 to 942.  |
| January 2007           | 01.4a           | Architecture                                | Added EBR Asynchronous Reset section.   |
| February 2007          | 01.4b           | Architecture                                | Updated EBR Asynchronous Reset section.   |
| March 2007             | 01.5            | Architecture                                | Added EBR asynchronous reset clarification  |
|                        |                 |   | Clarified that differential drivers are not supported in banks 1, 4 and 5   |
|                        |                 | DC and Switching Characteristics            | Added clarification for the description of the junction temperature specification in the Absolute Maximum Ratings section.  |
|                        |                 |   | Updated Initialization and Standby Current table.   |
|                        |                 |   | Updated LatticeSC External Switching Characteristics with ispLEVER 6.1 SP1 results.   |
