## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Details

|                                |                                                                                                                                                                               |

**Figure 2-7. Edge Clock Resources**

### Precision Clock Divider

Each set of edge clocks has four high-speed dividers associated with it. These are intended for generating a slower speed system clock from the high-speed edge clock. The block operates in a DIV2 or DIV4 mode and maintains a known phase relationship between the divided down clock and high-speed clock based on the release of its reset signal. The clock dividers can be fed from selected PIOs, PLLs and routing. The clock divider outputs serve as primary clock sources. This circuit also generates an edge local set/reset (ELSR) signal which is fed to the PIOs via the edge clock network and is used for the rest of the I/O gearing logic.

**Figure 2-8. Clock Divider Circuit**

### Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is

Figure 2-26. LatticeSC Banks

Table 2-7. Maximum Number of I/Os Per Bank in LatticeSC Family

| Device | LFSC/M15 | LFSC/M25 | LFSC/M40 | LFSC/M80 | LFSC/M115 |
|--------|----------|----------|----------|----------|-----------|
| Bank1  | 104      | 80       | 136      | 80       | 136       |
| Bank2  | 28       | 36       | 60       | 96       | 136       |
| Bank3  | 60       | 84       | 96       | 132      | 156       |
| Bank4  | 72       | 100      | 124      | 184      | 208       |
| Bank5  | 72       | 100      | 124      | 184      | 208       |
| Bank6  | 60       | 84       | 96       | 132      | 156       |
| Bank7  | 28       | 36       | 60       | 96       | 136       |

Note: Not all the I/Os of the Banks are available in all the packages

The LatticeSC devices contain three types of PURESPEED I/O buffers:

1. **Left and Right Sides (Banks 2, 3, 6 and 7)**

These buffers can support LVCMOS standards up to 2.5V. A differential output driver (for LVDS and RSFS) is provided on all primary PIO pairs (A and B) and differential receivers are available on all pairs. Complimentary drivers are available. Adaptive input logic is available on PIOs A or C.

2. **Top Side (Bank 1)**

These buffers can support LVCMOS standards up to 3.3V, including PCI33, PCI-X33 and SSTL-33. Differential receivers are provided on all PIO pairs but differential drivers for LVDS and RSFS are not available. Adaptive input logic is not available on this side. Complimentary output drivers are available.

**Figure 2-31. LatticeSC System Bus Interfaces**

Several interfaces exist between the System Bus and other FPGA elements. The MPI interface acts as a bridge between the external microprocessor bus and System Bus. The MPI may work in an independent clock domain from the System Bus if the System Bus clock is not sourced from the external microprocessor clock. Pipelined operation allows high-speed memory interface to the EBR and peripheral access without the requirement for additional cycles on the bus. Burst transfers allow optimal use of the memory interface by giving advance information of the nature of the transfers.

Details for the majority of the peripherals can be found in the associated technical documentation, see details at the end of this data sheet. Additional details of the MPI are provided below.

### Microprocessor Interface (MPI)

The LatticeSC family devices have a dedicated synchronous MPI function block. The MPI is programmable to operate with PowerPC/PowerQUICC MPC860/MPC8260 series microprocessors. The MPI implements an 8-, 16-, or 32-bit interface with 1-bit, 2-bit, or 4-bit parity to the host processor (PowerPC) that can be used for configuration and read-back of the FPGA as well as for user-defined data processing and general monitoring of FPGA functions.

The control portion of the MPI is available following power-up of the FPGA if the mode pins specify MPI mode, even if the FPGA is not yet configured. The width of the data port is selectable among 8-, 16-, or 32-bit and the parity bus can be 1-, 2-, or 4-bit. In configuration mode the data and parity bus width are related to the state of the M[0:3] mode pins. For post-configuration use, the MPI must be included in the configuration bit stream by using an MPI library element in your design from the ispLEVER primitive library, or by setting the bit of the MPI configuration control register prior to the start of configuration. The user can also enable and disable the parity bus through the configuration bit stream. These pads can be used as general I/O when they are not needed for MPI use.

The MPI block also provides the capability to interface directly to the FPGA fabric with a databus after configuration. The bus protocol is still handled by the MPI block but the direct FPGA access allows high-speed block data transfers such as DMA transactions. Figure 2-32 shows one of the ways a PowerPC is connected to MPI.

## Initialization and Standby Supply Current

The table below indicates initialization and standby supply current while operating at 85°C junction temperature ( $T_J$ ), which is the high end of the commercial temperature range, and 105°C, which is the high end of the industrial temperature range. This data assumes all outputs are tri-stated and all inputs are configured as LVCMOS and held at  $V_{CCIO}$  or GND. The remaining SERDES supply current for  $V_{DDIB}$  and  $V_{DDOB}$  is detailed in the SERDES section of this data sheet. For power at your design temperature, it is recommended to use the Power Calculator tool which is accessible in ispLEVER or can be used as a standalone tool. For more information on supply current, see the reference to additional technical documentation available at the end of this data sheet.

### Over Recommended Operating Conditions

| Symbol                   | Condition           | Parameter                                                                                          | Device    | 25°C<br>Typ. <sup>1</sup> | 85°C<br>Max. <sup>2</sup> |      | 105°C<br>Max. <sup>2</sup> | Units |

1.  $I_{CC}$  is specified at  $T_J = 25^\circ\text{C}$  and typical  $V_{CC}$ .

2.  $I_{CC}$  is specified at the respective commercial and industrial maximum  $T_J$  and  $V_{CC}$  limits.

1. Input only.

2. Inputs on chip. Outputs are implemented with the addition of external resistors.

3. Input for this standard does not depend on the value of V<sub>CCIO</sub>.

4. Inputs for this standard cannot be in 3.3V VCCIO banks (≤ 2.5V only).

|                |         | Supplemental Information         | Updated title list.                                                                                                                                                                                                    |
| November 2007  | 01.8    | Ordering Information             | Removed -7 speed grade information for 115K LUT devices in the Ordering Information tables.                                                                                                                            |
| January 2008   | 01.9    | Introduction                     | Corrections/Additions to memory controller list (Tables 1-2).                                                                                                                                                          |
|                |         | Architecture                     | AIL Overview – Modified power used by AIL block.                                                                                                                                                                       |
|                |         |                                  | PURESPEED I/O Buffer Banks – Modified VTT termination info. Added info about complimentary drivers for all banks.                                                                                                      |
|                |         |                                  | Supported Source Synchronous Interfaces – Modified data for DDRII in Table 2-11.                                                                                                                                       |
|                |         | DC and Switching Characteristics | Recommended Operating Conditions – Changed footnote 3.                                                                                                                                                                 |
|                |         |                                  | Initialization and Standby Supply Current – Inserted a paragraph with info regarding the table. Also updated the table.                                                                                                |
|                |         |                                  | Typical Building Block Function Performance – Added VCC=1.2V=1.2V+/-5% above Pin to Pin Performance table.                                                                                                             |
|                |         |                                  | LatticeSC External Switching Characteristics – Added VCC=1.2V=1.2V+/-5% above table. Reworded footnote 3.                                                                                                              |
|                |         |                                  | LatticeSC Family Timing Adders – Added VCC=1.2V=1.2V+/-5% above table.                                                                                                                                                 |
|                |         |                                  | LatticeSC Internal Timing Parameters – Added VCC=1.2V=1.2V+/-5% above table. Reworded footnote 1.                                                                                                                      |
|                |         |                                  | GSR Timing – Added a new table for Internal System Bus Timing after GSR Timing.                                                                                                                                        |
|                |         |                                  | LatticeSC sysCONFIG Port Timing – Corrected sysCONFIG SPI Port information.                                                                                                                                            |
|                |         | Pinout Information               | Signal Descriptions – Modified info for VTT_x, PROBE_VCC, and PROBE_GND. Modified info for [LOC]_DLL[T,C]_IN[C,D,E,F].                                                                                                 |
|                |         | Supplemental Information         | Updated list of technical notes, added reference to LatticeSC/M flexiPCS Data Sheet.                                                                                                                                   |
| March 2008     | 02.0    | DC and Switching Characteristics | Updated Internal Timing Parameters table.                                                                                                                                                                              |
|                |         |                                  | Updated Read Mode timing diagram.                                                                                                                                                                                      |
|                |         |                                  | Updated Read Mode with Input Registers Only timing diagram.                                                                                                                                                            |
| June 2008      | 02.1    | —                                | Data sheet status changed from preliminary to final.                                                                                                                                                                   |
|                |         | Architecture                     | Removed Read-Before-Write sysMEM EBR mode.                                                                                                                                                                             |
|                |         | DC and Switching Characteristics | Updated LatticeSC/M External Switching Characteristics table.                                                                                                                                                          |
|                |         |                                  | Updated LatticeSC/M Internal Timing Parameters table.                                                                                                                                                                  |
| December 2008  | 02.2    | Architecture                     | Removed Read-Before-Write sysMEM EBR mode.                                                                                                                                                                             |
|                |         |                                  | Output/Tristate DDR/Shift Register Block Diagram - corrected connection to POS.                                                                                                                                        |
|                |         | DC and Switching Characteristics | DC and Switching Characteristics table - updated data for $t_{SUI\_PIO}$ .                                                                                                                                             |
|                |         |                                  | Added $T_R$ , $T_F$ parameter to PURESPEED I/O Differential Electrical Characteristics (LVDS) table.                                                                                                                   |
| January 2010   | 02.3    | Multiple                         | Removed references to HyperTransport throughout the data sheet.                                                                                                                                                        |
|                |         | Introduction                     | Updated per PCN #01A-10 (ceramic fcBGA conversion to organic fcBGA for the 1152-ball and 1704-ball fcBGA packages) and PCN #02A-10 (1020-ball organic fcBGA conversion to 1020-ball organic fcBGA revision 2 package). |
|                |         | Ordering Information             |                                                                                                                                                                                                                        |
